

10-Channel Level Shifter and VCOM Buffer

FEATURES

- 10-Channel Level Shifter, Organized as Two Groups of 8 + 2 Channels
- Separate Positive Supplies (V_{GH}) for Each Group
- V_{GH} Levels up to 38V
- V_{GL} Levels down to -13V
- Logic Level Inputs
- High Peak Output Currents
- High-Speed V_{COM} Buffer
- 28-Pin 5x5 mm QFN Package

APPLICATIONS

- Large Format LCD Displays using GIP Technology

DESCRIPTION

The TPS65190 is a combined multi-channel level-shifter and V_{COM} buffer intended for use in large format LCD display applications such as TVs and monitors. The device converts the logic-level signals generated by the Timing Controller (T-CON) to the high-level gate drive signals used by the display panel and amplifies/buffers an externally generated V_{COM} voltage.

The 10 level shifter channels are organized as 2 groups, each with its own positive supply. Channels 1-6 and 9-10 are supplied by V_{GH1} and channels 7-8 are supplied by V_{GH2} . The two positive supplies can be tied together if one positive supply voltage is used for all level shifter channels. Both level shifter groups use the same negative supply V_{GL} .

The level-shifters feature low impedance output stages that achieve fast rise and fall times even when driving significant capacitive loads.

The uncommitted high-speed operational amplifier features a high slew rate and high peak current capability that make it particularly suitable for driving the panel's common rail (V_{COM}).

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

DETAILED DESCRIPTION

The TPS65190 contains 10 level shifter channels and one high-speed operational amplifier.

The 10 level shifter channels are organized in two groups: the first group, comprising channels 1-6 and 9-10 is powered from V_{VGH1} and V_{GL} ; the second group, comprising channels 7 and 8 is powered from V_{VGH2} and V_{GL} . Channels 1 to 8 are optimized for high speed operation while channels 9 and 10 operate a little slower.

All level shifter channels feature the same input circuitry and are compatible with the standard logic-level signals generated by timing controllers in typical applications. The output circuitry has been designed to achieve high rise and fall times when driving the capacitive loads typically encountered in LCD display applications

The input and output stages of the operational amplifier extend close to both supply rails and the output stage has been optimized to supply the fast transient currents typical in V_{COM} applications.

APPLICATION INFORMATION

It is recommended to use high quality ceramic capacitors to decouple each supply pin. In typical applications 10 μ F is recommended for V_{VGH1} and V_{GL} , while 1 μ F is normally sufficient for V_{VGH2} .

Use level shifter channels 1 to 8 for high-speed clock signals and use channels 9 to 10 for lower-speed signals (see Figure 14). The inputs of any unused level shifter channels should be tied to GND. The outputs of any unused level shifter channels should be left floating.

It is recommended to use low-value feedback resistors with the VCOM buffer to minimize the effects of stray capacitance at its inverting input. Using high value feedback resistors can cause excessive peaking in the amplifier's gain response (caused by pole formed by the feedback resistor and the stray capacitance). If the VCOM buffer is used in a unity gain configuration, the flattest gain response is achieved using a direct connection between the amplifier's output and inverting input.

If the VCOM buffer is not used, tie AVDD, its inverting and non-inverting inputs, and its output to GND.

Figure 21. Typical Application Circuit

PCB LAYOUT

Proper PCB layout is essential if the TPS65190's specified performance is to be achieved, and the following basic steps should be followed as a minimum:

1. Use high quality ceramic decoupling capacitors, placed as close as possible to the IC pins they are decoupling
2. Use short, wide tracks to route power to the IC
3. Ensure that the PCB's thermal design is adequate to dissipate power away from the IC

The TPS65190 is supplied in a 28-Pin QFN thermally enhanced package designed to eliminate the use of bulky heat sinks and slugs. In order to benefit from these superior thermal properties PCB layout and manufacturing should follow the guidelines contained in the following application reports, available for free download from <http://www.ti.com>.

- Application Report – QFN Layout Guidelines ([SLOA122](#))
- Application Report – QFN/SON PCB Attachment ([SLUA271A](#))

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS65190RHDR	ACTIVE	VQFN	RHD	28	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	TPS 65190	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
