

LMV7231 Hex Window Comparator With 1.5% Precision and 400-mV Reference

1 Features

- (For $V_S = 3.3\text{ V} \pm 10\%$, Typical Unless Otherwise Noted)
- Undervoltage and Overvoltage Detection
- High Accuracy Voltage Reference: 400 mV
- Threshold Accuracy: $\pm 1.5\%$ (Maximum)
- Wide Supply Voltage Range 2.2 V to 5.5 V
- Input and Output Voltage Range Above V_+
- Internal Hysteresis: 6 mV
- Propagation Delay: 2.6 μs to 5.6 μs
- Supply Current 7.7 μA Per Channel
- 24-Lead WQFN Package
- Temperature Range: -40°C to $+125^\circ\text{C}$

2 Applications

- Power Supply Voltage Monitoring
- Battery Monitoring
- Handheld Instruments
- Relay Driving
- Industrial Control Systems

3 Description

The LMV7231 device is a 1.5% accurate Hex Window Comparator which can be used to monitor power supply voltages or any other analog output, such as an analog temperature sensor or current-sense amplifier. The device uses an internal 400-mV reference for the comparator trip value. The comparator set points can be set through external resistor dividers. The LMV7231 has 6 outputs (CO1 to CO6) that signal an undervoltage or overvoltage event for each power supply input. An output (AO) is also provided to signal when any of the power supply inputs have an overvoltage or undervoltage event. This ability to signal an undervoltage or overvoltage event for the individual power supply inputs, in addition to an output to signal such an event on any of the power supply inputs, adds unparalleled system protection capability.

The 2.2-V to 5.5-V power supply voltage range, low supply current, and input or output voltage range above V_+ make the LMV7231 ideal for a wide range of power supply monitoring applications. Operation is ensured over the -40°C to $+125^\circ\text{C}$ temperature range. The device is available in a 24-pin WQFN package.

Device Information⁽¹⁾

| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
|-------------|-----------|-------------------|
| LMV7231 | WQFN (24) | 4.00 mm x 4.00 mm |

6 Specifications

6.1 Absolute Maximum Ratings

 See ⁽¹⁾⁽²⁾⁽³⁾.

| | MIN | MAX | UNIT |
|---------------------------------------|-----------|-----|------|
| Supply voltage | | 6 | V |
| Voltage at input / output pin | GND – 0.3 | 6 | V |
| Output current | | 10 | mA |
| Total package current | | 50 | mA |
| Junction temperature ⁽⁴⁾ | | 150 | °C |
| Storage temperature, T _{stg} | –65 | 150 | °C |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) If Military/Aerospace specified devices are required, contact the Texas Instruments Sales Office/Distributors for availability and specifications.
- (3) For soldering specifications, see *Absolute Maximum Ratings for Soldering* (SNOA549).
- (4) The maximum power dissipation is a function of T_{J(MAX)}, R_{θJA}. The maximum allowable power dissipation at any ambient temperature is P_D = (T_{J(MAX)} – T_A) / R_{θJA}. All numbers apply for packages soldered directly onto a PCB.

6.2 ESD Ratings

| | | VALUE | UNIT |
|--------------------|-------------------------|--|-------|
| V _(ESD) | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾⁽²⁾ | ±2000 |
| | | Machine model | ±200 |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) Human Body Model, applicable std. MIL-STD-883, Method 3015.7. Machine Model, applicable std. JESD22-A115-A (ESD MM std. of JEDEC) Field-Induced Charge-Device Model, applicable std. JESD22-C101-C (ESD FICDM std. of JEDEC).

6.3 Recommended Operating Conditions

| | MIN | MAX | UNIT |
|-------------------------------------|-----|-----|------|
| Supply voltage | 2.2 | 5.5 | V |
| Junction temperature ⁽¹⁾ | –40 | 125 | °C |

- (1) The maximum power dissipation is a function of T_{J(MAX)}, R_{θJA}. The maximum allowable power dissipation at any ambient temperature is P_D = (T_{J(MAX)} – T_A) / R_{θJA}. All numbers apply for packages soldered directly onto a PCB.

6.4 Thermal Information

| THERMAL METRIC ⁽¹⁾ | | LMV7231 | UNIT |
|-------------------------------|--|------------|------|
| | | RTW (WQFN) | |
| | | 24 PINS | |
| R _{θJA} | Junction-to-ambient thermal resistance | 37.4 | °C/W |
| R _{θJC(top)} | Junction-to-case (top) thermal resistance | 40.2 | °C/W |
| R _{θJB} | Junction-to-board thermal resistance | 16.1 | °C/W |
| ψ _{JT} | Junction-to-top characterization parameter | 0.6 | °C/W |
| ψ _{JB} | Junction-to-board characterization parameter | 16.2 | °C/W |
| R _{θJC(bot)} | Junction-to-case (bottom) thermal resistance | 5.2 | °C/W |

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 3.3-V Electrical Characteristics

Unless otherwise specified, all limits ensured for T_A = 25°C, V₊ = 3.3 V ±10%, GND = 0 V, and R_L > 1 MΩ.

| PARAMETER | TEST CONDITION | | MIN ⁽¹⁾ | TYP ⁽²⁾ | MAX ⁽¹⁾ | UNIT | |
|--------------------|---|---|---------------------------------|----------------------|----------------------|-------|----|
| V _{THR} | Threshold: input rising | R _L = 10 kΩ | | 394 | 400 | 406 | mV |
| | | | T _A = -10°C to +70°C | 391.4 | | 408.6 | |
| V _{THF} | Threshold: input falling | R _L = 10 kΩ | | 386 | 394 | 401 | mV |
| | | | T _A = -10°C to +70°C | 383.8 | | 403.2 | |
| V _{HYST} | Hysteresis (V _{THR} - V _{THF}) | R _L = 10 kΩ | | 3.9 | 6.0 | 8.8 | mV |
| I _{BIAS} | Input bias current | V _{IN} = V ₊ , GND, and 5.5 V | | -5 | 0.05 | 5 | nA |
| | | | T _A = -10°C to +70°C | -15 | | 15 | |
| V _{OL} | Output low voltage | I _L = 5 mA | | | 160 | 200 | mV |
| | | | T _A = -10°C to +70°C | | | 250 | |

| | | | T _A = -10°C to +70°C | | | | |
| t _{PDHL1} | High-to-low propagation delay (+IN falling) | 10 mV of overdrive | | 2.6 | | 6 | μs |
| t _{PDHL2} | High-to-low propagation delay (-IN rising) | 10 mV of overdrive | | 5.4 | | 10 | μs |
| t _{PDHL1} | Low-to-high propagation delay (+IN rising) | 10 mV of overdrive | | 5.6 | | 10 | μs |
| t _{PDHL2} | Low-to-high propagation delay (-IN falling) | 10 mV of overdrive | | 2.8 | | 6 | μs |
| t _r | Output rise time | C _L = 10 pF, R _L = 10 kΩ | | 0.5 | | | μs |
| t _f | Output fall time | C _L = 100 pF, R _L = 10 kΩ | | | | 0.25 | μs |
| | | | T _A = -10°C to +70°C | | | | |
| I _{IN(1)} | Digital input logic 1 leakage current | T _A = -10°C to +70°C | | | | 0.2 | μA |
| | | | | | | 1 | |
| I _{IN(0)} | Digital input logic 0 leakage current | T _A = -10°C to +70°C | | | | 0.2 | μA |
| | | | | | | 1 | |
| V _{IH} | Digital input logic 1 voltage | T _A = -10°C to +70°C | | 0.7 × V ₊ | | | V |
| V _{IL} | Digital input logic 0 voltage | T _A = -10°C to +70°C | | | 0.3 × V ₊ | | V |
| I _S | Power supply current | No loading (outputs high) | | 46 | | 60 | μA |
| | | | T _A = -10°C to +70°C | | | | |
| V _{THPSS} | V _{TH} power supply sensitivity ⁽³⁾ | V ₊ ramp rate = 1.1 ms V ₊ step = 2.5 V to 4.5 V | | | | 400 | μV |
| | | V ₊ ramp rate = 1.1 ms V ₊ step = 4.5 V to 2.5 V | | -400 | | | μV |

- (1) Limits are 100% production tested at 25°C. Limits over the operating temperature range are specified through correlations using the Statistical Quality Control (SQC) method.
- (2) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and also depends on the application and configuration. The typical values are not tested and are not ensured on shipped production material.
- (3) V_{TH} power supply sensitivity is defined as the temporary shift in the internal voltage reference due to a step on the V₊ pin.

7 Detailed Description

7.1 Overview

The LMV7231 is Hex Window Comparator which can be used to monitor power supply voltages and other critical system voltage levels.

The LMV7231 contains 6 identical window comparators where the upper and lower trip points are set through external resistor dividers. Each input of the comparator is compared to a internal 1.5% accurate 400-mV reference voltage (V_{REF}).

The 6 window comparator outputs (CO1-CO6) signal an undervoltage or overvoltage event for each power supply input. The COPOL pin sets the *inside* or *outside* of the window indication.

A combined OR'ed output (AO) is also provided to signal when any of the power supply inputs have an overvoltage or undervoltage event. AOSEL sets the logic polarity to create a power-good or error signal.

7.2 Functional Block Diagram

7.3 Feature Description

The LMV7231 Hex Window Comparator with 1.5% precision can accurately monitor up to 6 power rails or batteries at one time. The input and output voltages of the device can exceed the supply voltage, $V+$, of the comparator, and can be up to the maximum ratings listed in the [Absolute Maximum Ratings](#) without causing damage or performance degradation. The typical microcontroller input pin with crowbar diode ESD protection circuitry does not allow the input to go above $V+$, and thus its usefulness is limited in power supply supervision applications.

7.3.1 Input and Output Voltage Range Above $V+$

The supply independent inputs of the window comparator blocks allow the LMV7231 to be tolerant of system faults. For example, if the power is suddenly removed from the LMV7231 due to a system malfunction while a voltage still exists on the input, it is not an issue as long as the monitored input voltage does not exceed the absolute maximum ratings. Another example where this feature comes in handy is a battery-sense application such as the one in [Figure 32](#). The boards may be sitting on the shelf unbiased with $V+$ grounded, and yet have a fully charged battery onboard. If the comparator measuring the battery had crowbar diodes, the diode from $-IN$ to $V+$ would turn on, sourcing current from the battery, eventually draining the battery. However, when using the LMV7231 no current, except the low input bias current of the device, flows into the chip, and the battery charge is preserved.

Figure 32. Battery-Sense Application

The output pin voltages of the device can also exceed the supply voltage, $V+$, of the comparator. This provides extra flexibility and enables designs which pull up the outputs to higher voltage levels to meet system requirements. For example, it is possible to run the LMV7231 at its minimum operating voltage, $V+ = 2.2$ V, but to bias a blue LED, pull up the output listed in the [Absolute Maximum Ratings](#), with a forward voltage of $V_F = 4$ V.

In a power supply supervision application, the hardwired LMV7231 is a sound solution compared to the microcontroller with software alternative for several reasons. First, start-up is faster. During start-up, code loading time, oscillator ramp time, and reset time do not need to be accounted for. Second, operation is quick. The LMV7231 has a maximum propagation delay and is not affected by sampling and conversion delays related to reading data, calculating data, and setting flags. Third, the device has less overhead. The LMV7231 does not require an expensive power-consuming microcontroller nor is it dependent on controller code which could get damaged or crash.

7.4 Device Functional Modes

7.4.1 $+IN1$ through $+IN6$ Input Pins

These inputs set the upper threshold voltage of the channel window comparator. The input voltage is compared to the internal 400-mV reference. These inputs are capable of input voltages up to the [Absolute Maximum Ratings](#) (6 V), independent of the $V+$ supply voltage.

7.4.2 $-IN1$ through $-IN6$ Input Pins

These inputs set the lower threshold voltage of the channel window comparator. The input voltage is compared to the internal 400-mV reference. These inputs are capable of input voltages up to the [Absolute Maximum Ratings](#) (6 V), independent of the $V+$ supply voltage.

Device Functional Modes (continued)

Therefore, there are $2^2 = 4$ different optimization cases:

1. Exiting the voltage detection window (Figure 34)
2. Rising into and out of the window (Figure 35)
3. Entering the window (Figure 36)
4. Falling into and out of the window (Figure 37)

R3 set

$$R2 = R3((V_{THF}/V_{THR})V_{OV}/V_{UV} \pm 1)$$

$$R1 = R3((1/V_{THR})V_{OV} - (V_{THF}/V_{THR})V_{OV}/V_{UV})$$

Ex. $V_{OV} = 3.465$ V, $V_{UV} = 3.135$ V, that is, $V_{RANGE} = 3.3$ V \pm 5%

R3 set to 10 k Ω

$$R2 = 10k((0.394/0.4)3.465/3.135 \pm 1) \approx 887 \Omega$$

$$R1 = 10k((1/0.4)3.465 - (0.394/0.4)3.465/3.135) \approx 75 \text{ k}\Omega$$

Figure 34. Exiting the Voltage Detection Window

R3 set

$$R2 = R3(V_{OV}/V_{UV} \pm 1)$$

$$R1 = R3((1/V_{THR})V_{OV} - V_{OV}/V_{UV})$$

Ex. $V_{OV} = 3.465$ V, $V_{UV} = 3.135$ V, that is, $V_{RANGE} = 3.3$ V \pm 5%

R3 set to 10 k Ω

$$R2 = 10k((3.465/3.135) \pm 1) \approx 1.05 \text{ k}\Omega$$

$$R1 = 10k((1/0.4)3.465 \pm 3.465/3.135) \approx 75 \text{ k}\Omega$$

Figure 35. Rising into and out of the Voltage Detection Window

R3 set

$$R2 = R3((V_{THR}/V_{THF})V_{OV}/V_{UV} \pm 1)$$

$$R1 = R3((1/V_{THF})V_{OV} - (V_{THR}/V_{THF})V_{OV}/V_{UV})$$

Ex. $V_{OV} = 3.465$ V, $V_{UV} = 3.135$ V, that is, $V_{RANGE} = 3.3$ V \pm 5%

R3 set to 10 k Ω

$$R2 = 10k((0.4/0.394)3.465/3.135 \pm 1) \approx 1.21 \text{ k}\Omega$$

$$R1 = 10k((1/0.394)3.465 - (0.4/0.394)3.465/3.135) \approx 76.8 \text{ k}\Omega$$

Figure 36. Entering the Voltage Detection Window

R3 set

$$R2 = R3(V_{OV}/V_{UV} \pm 1)$$

$$R1 = R3((1/V_{THF})V_{OV} - V_{OV}/V_{UV})$$

Ex. $V_{OV} = 3.465$ V, $V_{UV} = 3.135$ V, that is, $V_{RANGE} = 3.3$ V \pm 5%

R3 set to 10 k Ω

$$R2 = 10k((3.465/3.135) \pm 1) \approx 1.05 \text{ k}\Omega$$

$$R1 = 10k((1/0.394)3.465 \pm 3.465/3.135) \approx 76.8 \text{ k}\Omega$$

Figure 37. Falling into and out of the Voltage Detection Window

NOTE

For each case, each trip point can be optimized for either a rising or falling signal, but not both.

Device Functional Modes (continued)

The governing equations make it such that if the same resistor, R3, and overvoltage-to-undervoltage ratio, V_{OV}/V_{UV} , is used across the channels, the same nominal current travels through the resistor ladder. As a result, R2 is also the same across all channels, and only R1 needs to change to set voltage detection window maximizing reuse of resistor values and minimizing design complexity.

Select the R3 resistor value to be below 100 k Ω so the resistor current through the divider ladder is much greater than the LMV7231 bias current (15 nA worst case, 50 pA typical). If the current traveling through the resistor divider is on the same magnitude of the LMV7231 I_{BIAS} , the I_{BIAS} current creates an error in the circuit and causes trip voltage shifts. The greatest error due to I_{BIAS} is caused when that current passes through the greatest equivalent resistance, $R_{EQ} = R1 \parallel (R2 + R3)$, which is detected by the positive input of the window comparator, +IN.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LMV7231 is specified for operation from 2.2 V to 5.5 V. Some of the specifications apply from -10°C to $+70^{\circ}\text{C}$. Parameters that can exhibit significant variance with regard to operating voltage or temperature are presented in the [Typical Characteristics](#) and the [3.3-V Electrical Characteristics](#).

8.2 Typical Application

Figure 38 shows a typical power supply supervision circuit using the LMV7231 and the efficient, easy to use LM25007 step-down switching regulator.

Figure 38. Power Supply Supervision

8.2.1 Design Requirements

Table 1 describes the requested design parameters.

Table 1. Design Parameters

| PARAMETER | EXAMPLE VALUE |
|------------------------------------|------------------------------|
| Logic Supply Voltage | 3.3 V |
| Monitored Voltage | 5 V |
| Monitored Voltage Tolerance Window | $\pm 5\%$ (4.75 V to 5.25 V) |

8.2.2 Detailed Design Procedure

The regulators output voltage is set to 5 V, according to the LM25007 data sheet, [SNVS401](#).

$$V_{OUT} = 2.5 \times (R2 + R3) / R3 \quad (1)$$

$$V_{OUT} = 2.5 \times (3 \text{ k}\Omega + 3 \text{ k}\Omega) / 3 \text{ k}\Omega = 5 \text{ V} \quad (2)$$

Resistor R6 and capacitors C6, C7 are utilized to minimize output ripple voltage per the *AN-1453 LM25007 Evaluation Board*, ([SNVA152](#)).

The comparator voltage window is set to 5 V \pm 5%. This requires input voltages of 420 mV and 380 mV, which calculates to R7 = 1.15 k Ω , R8 = 10 Ω , R9 = 95.3 Ω . See the *Three-Resistor Voltage Divider Selection* section for details on how to set the comparator voltage window.

With the components selected, the output ripple voltage on the LM25007 is approximately 30 to 35 mV and is reduced to about 4 mV at the comparator input, +IN1, by the resistor divider. This ripple voltage can be reduced multiple ways. First, user can operate the device in continuous conduction mode rather than discontinuous conduction mode. To do this increase the load current of the device (see [SNVS401](#) for more details). However, the power rating of the resistors in the resistor ladder must not be exceeded. Second, ripple can be reduced further with a bypass capacitor, C9, at the resistor divider. If desired, select a 1- μ F capacitor to achieve less than 3-mV ripple at +IN1. However, there is a trade-off that adding capacitance at this node lowers the system response time.

8.2.3 Application Curve

[Figure 39](#) shows the results of sweeping the regulator output voltage through the undervoltage and overvoltage thresholds. COPOL is set LOW so that the output goes LOW while the regulator voltage is within the \pm 5% thresholds.

Figure 39. Power Supply Supervisor Thresholds

9 Power Supply Recommendations

Bypass the supply pin, V+, with a 0.1- μ F ceramic capacitor placed close to the V+ pin. If transients with rise or fall times of hundreds of μ s and magnitudes of hundreds of mV are expected on the power supply line, an RC lowpass filter network as shown in Figure 40 is recommended for additional bypassing. If no such bypass network is used power supply transients can cause the internal voltage reference of the comparator to temporarily shift potentially resulting in a brief incorrect comparator output. For example, if an RC network with 100- Ω resistance and 10- μ F capacitance (1.1-ms rise time) is used the voltage reference temporarily shifts the amount, V_{TH} power supply sensitivity ($V_{TH}PSS$), specified in the 3.3-V Electrical Characteristics table.

10 Layout

10.1 Layout Guidelines

Proper grounding and the use of a ground plane helps to ensure the specified performance of the LMV7231. Minimizing trace lengths, reducing unwanted parasitic capacitance, and using surface-mount components also helps. Comparators are very sensitive to input noise.

1. Use a printed-circuit-board with a good, unbroken low-inductance ground plane.
2. Place a decoupling capacitor (0.1- μ F ceramic surface mount capacitor) as close to V+ pin as possible.
3. On the inputs and the outputs, keep lead lengths and the divider resistors as short possible to avoid noise pick-up.

The DAP pad is connected to the bottom of the die and is not designed to carry current. The DAP thermal pad must be connected directly to the GND pin to avoid noise and possible voltage gradients. The primary grounding pin is the GND pin.

11.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.4 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead finish/ Ball material (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |
|------------------|---------------|--------------|-----------------|------|-------------|-----------------|--------------------------------------|----------------------|--------------|-------------------------|-------------------------|
| LMV7231SQ/NOPB | ACTIVE | WQFN | RTW | 24 | 1000 | RoHS & Green | SN | Level-1-260C-UNLIM | -40 to 125 | L7231SQ | Samples |
| LMV7231SQE/NOPB | ACTIVE | WQFN | RTW | 24 | 250 | RoHS & Green | SN | Level-1-260C-UNLIM | -40 to 125 | L7231SQ | Samples |
| LMV7231SQX/NOPB | ACTIVE | WQFN | RTW | 24 | 4500 | RoHS & Green | SN | Level-1-260C-UNLIM | -40 to 125 | L7231SQ | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

| Device | Package Type | Package Drawing | Pins | SPQ | Reel Diameter (mm) | Reel Width W1 (mm) | A0 (mm) | B0 (mm) | K0 (mm) | P1 (mm) | W (mm) | Pin1 Quadrant |
|-----------------|--------------|-----------------|------|------|--------------------|--------------------|---------|---------|---------|---------|--------|---------------|
| LMV7231SQ/NOPB | WQFN | RTW | 24 | 1000 | 178.0 | 12.4 | 4.3 | 4.3 | 1.3 | 8.0 | 12.0 | Q1 |
| LMV7231SQE/NOPB | WQFN | RTW | 24 | 250 | 178.0 | 12.4 | 4.3 | 4.3 | 1.3 | 8.0 | 12.0 | Q1 |
| LMV7231SQX/NOPB | WQFN | RTW | 24 | 4500 | 330.0 | 12.4 | 4.3 | 4.3 | 1.3 | 8.0 | 12.0 | Q1 |

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

| Device | Package Type | Package Drawing | Pins | SPQ | Length (mm) | Width (mm) | Height (mm) |
|-----------------|--------------|-----------------|------|------|-------------|------------|-------------|
| LMV7231SQ/NOPB | WQFN | RTW | 24 | 1000 | 208.0 | 191.0 | 35.0 |
| LMV7231SQE/NOPB | WQFN | RTW | 24 | 250 | 208.0 | 191.0 | 35.0 |
