

DRV835xF 100-V Three-Phase Smart Gate Driver

1 Features

- 9 to 100-V, Triple half-bridge gate driver
 - Optional triple low-side current shunt amplifiers
- [Functional Safety Quality-Managed](#)
 - Documentation available to aid IEC 61800-5-2 functional safety system design
- Smart gate drive architecture
 - Adjustable slew rate control for EMI performance
 - V_{GS} handshake and minimum dead-time insertion to prevent shoot-through
 - 50-mA to 1-A peak source current
 - 100-mA to 2-A peak sink current
 - dV/dt mitigation through strong pulldown
- Integrated gate driver power supplies
 - High-side doubler charge pump For 100% PWM duty cycle control
 - Low-side linear regulator
- Integrated triple current shunt amplifiers
 - Adjustable gain (5, 10, 20, 40 V/V)
 - Bidirectional or unidirectional support
- 6x, 3x, 1x, and independent PWM modes
 - Supports 120° sensed operation
- SPI or hardware interface available
- Low-power sleep mode (20 μ A at $V_{VM} = 48$ -V)
- Integrated protection features
 - VM undervoltage lockout (UVLO)
 - Gate drive supply undervoltage (GDUV)
 - MOSFET V_{DS} overcurrent protection (OCP)
 - MOSFET shoot-through prevention
 - Gate driver fault (GDF)
 - Thermal warning and shutdown (OTW/OTSD)
 - Fault condition indicator (nFAULT)

components that are typically necessary for MOSFET slew rate control and protection circuits. The SGD architecture also optimizes dead time to prevent shoot-through conditions, provides flexibility in decreasing electromagnetic interference (EMI) by MOSFET slew rate control, and protects against gate short circuit conditions through V_{GS} monitors. A strong gate pulldown circuit helps prevent unwanted dV/dt parasitic gate turn on events

Various PWM control modes (6x, 3x, 1x, and independent) are supported for simple interfacing to the external controller. These modes can decrease the number of outputs required of the controller for the motor driver PWM control signals. This family of devices also includes 1x PWM mode for simple sensed trapezoidal control of a BLDC motor by using an internal block commutation table.

Device Information

(1)PART NUMBER	PACKAGE	BODY SIZE (NOM)
DRV8350F	WQFN (32)	5.00 mm × 5.00 mm
DRV8353F	WQFN (40)	6.00 mm × 6.00 mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.

Simplified Schematic

2 Applications

- [Servo drives, Factory automation](#)
- [Linear motor transport systems](#)
- [Industrial collaborative robot](#)
- [Autonomous Guided Vehicle, Delivery Drones](#)
- [E-Bikes, E-scooters, and E-mobility](#)

3 Description

The DRV835xF family of devices are highly-integrated gate drivers for three-phase brushless DC (BLDC) motor applications. The device variants provide optional integrated current shunt amplifiers to support different motor control schemes.

The DRV835xF uses smart gate drive (SGD) architecture to decrease the number of external

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision A (October 2020) to Revision B (August 2021)	Page
• Removed references to DRV8353RF and DRV8350RF.....	1
• Updated Primary and Alternative Application Diagrams.....	56
• Updated Layout Example.....	70
• Updated Device Nomenclature.....	71

Changes from Revision * (August 2018) to Revision A (October 2020)	Page
• Changed document status to production data.....	1
• Deleted preview only note from DRV8350 and DRV8353 devices.....	1

Pin Functions—32-Pin DRV8350F Devices

NAME	PIN NO.		TYPE ⁽¹⁾	DESCRIPTION
	DRV8350FH	DRV8350FS		
CPH	1	1	PWR	Charge pump switching node. Connect a X5R or X7R, 47-nF, VDRAIN-rated ceramic capacitor between the CPH and CPL pins.
CPL	32	32	PWR	Charge pump switching node. Connect a X5R or X7R, 47-nF, VDRAIN-rated ceramic capacitor between the CPH and CPL pins.
DVDD	29	29	PWR	5-V internal regulator output. Connect a X5R or X7R, 1-μF, 6.3-V ceramic capacitor between the DVDD and GND pins. This regulator can source up to 10 mA externally.
ENABLE	22	22	I	Gate driver enable. When this pin is logic low the device goes to a low power sleep mode. An 8 to 40-μs pulse can be used to reset fault conditions.
GHA	5	5	O	High-side gate driver output. Connect to the gate of the high-side power MOSFET.
GHB	12	12	O	High-side gate driver output. Connect to the gate of the high-side power MOSFET.
GHC	13	13	O	High-side gate driver output. Connect to the gate of the high-side power MOSFET.
GLA	7	7	O	Low-side gate driver output. Connect to the gate of the low-side power MOSFET.
GLB	10	10	O	Low-side gate driver output. Connect to the gate of the low-side power MOSFET.
GLC	15	15	O	Low-side gate driver output. Connect to the gate of the low-side power MOSFET.
GND	30	30	PWR	Device primary ground. Connect to system ground.
IDRIIVE	19	—	I	Gate drive output current setting. This pin is a 7 level input pin set by an external resistor.
INHA	23	23	I	High-side gate driver control input. This pin controls the output of the high-side gate driver.
INHB	25	25	I	High-side gate driver control input. This pin controls the output of the high-side gate driver.
INHC	27	27	I	High-side gate driver control input. This pin controls the output of the high-side gate driver.
INLA	24	24	I	Low-side gate driver control input. This pin controls the output of the low-side gate driver.

PIN			TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.			
	DRV8350FH	DRV8350FS		
INLB	26	26	I	Low-side gate driver control input. This pin controls the output of the low-side gate driver.
INLC	28	28	I	Low-side gate driver control input. This pin controls the output of the low-side gate driver.
MODE	18	—	I	PWM input mode setting. This pin is a 4 level input pin set by an external resistor.
NC	21	—	NC	No internal connection. This pin can be left floating or connected to system ground.
nFAULT	17	17	OD	Fault indicator output. This pin is pulled logic low during a fault condition and requires an external pullup resistor.
nSCS	—	21	I	Serial chip select. A logic low on this pin enables serial interface communication.
SCLK	—	20	I	Serial clock input. Serial data is shifted out and captured on the corresponding rising and falling edge on this pin.
SDI	—	19	I	Serial data input. Data is captured on the falling edge of the SCLK pin.
SDO	—	18	OD	Serial data output. Data is shifted out on the rising edge of the SCLK pin. This pin requires an external pullup resistor.
SHA	6	6	I	High-side source sense input. Connect to the high-side power MOSFET source.
SHB	11	11	I	High-side source sense input. Connect to the high-side power MOSFET source.
SHC	14	14	I	High-side source sense input. Connect to the high-side power MOSFET source.
SLA	8	8	I	Low-side source sense input. Connect to the low-side power MOSFET source.
SLB	9	9	I	Low-side source sense input. Connect to the low-side power MOSFET source.
SLC	16	16	I	Low-side source sense input. Connect to the low-side power MOSFET source.
VCP	4	4	PWR	Charge pump output. Connect a X5R or X7R, 1-μF, 16-V ceramic capacitor between the VCP and VDRAIN pins.
VDRAIN	3	3	I	High-side MOSFET drain sense input and charge pump reference. Connect to the common point of the MOSFET drains.
VDS	20	—	I	VDS monitor trip point setting. This pin is a 7 level input pin set by an external resistor.
VGLS	31	31	PWR	11-V internal regulator output. Connect a X5R or X7R, 1-μF, 16-V ceramic capacitor between the VGLS and GND pins.
VM	2	2	PWR	Gate driver power supply input. Connect to either VDRAIN or separate gate driver supply voltage. Connect a X5R or X7R, 0.1-μF, VM-rated ceramic and greater then or equal to 10-μF local capacitance between the VM and GND pins.

(1) PWR = power, I = input, O = output, NC = no connection, OD = open-drain

Pin Functions—40-Pin DRV8353F Devices

PIN			TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.			
	DRV8353FH	DRV8353FS		
AGND	25	25	PWR	Device analog ground. Connect to system ground.
CPH	2	2	PWR	Charge pump switching node. Connect a X5R or X7R, 47-nF, VDRAIN-rated ceramic capacitor between the CPH and CPL pins.

NAME	PIN		TYPE ⁽¹⁾	DESCRIPTION
	NO.			
	DRV8353FH	DRV8353FS		
CPL	1	1	PWR	Charge pump switching node. Connect a X5R or X7R, 47-nF, VDRAIN-rated ceramic capacitor between the CPH and CPL pins.
DVDD	38	38	PWR	5-V internal regulator output. Connect a X5R or X7R, 1-μF, 6.3-V ceramic capacitor between the DVDD and GND pins. This regulator can source up to 10 mA externally.
ENABLE	31	31	I	Gate driver enable. When this pin is logic low the device goes to a low power sleep mode. An 8 to 40-μs low pulse can be used to reset fault conditions.
GAIN	30	—	I	Amplifier gain setting. The pin is a 4 level input pin set by an external resistor.
GND	39	39	PWR	Device power ground. Connect to system ground.
GHA	6	6	O	High-side gate driver output. Connect to the gate of the high-side power MOSFET.
GHB	15	15	O	High-side gate driver output. Connect to the gate of the high-side power MOSFET.
GHC	16	16	O	High-side gate driver output. Connect to the gate of the high-side power MOSFET.
GLA	8	8	O	Low-side gate driver output. Connect to the gate of the low-side power MOSFET.
GLB	13	13	O	Low-side gate driver output. Connect to the gate of the low-side power MOSFET.
GLC	18	18	O	Low-side gate driver output. Connect to the gate of the low-side power MOSFET.
IDRIVE	28	—	I	Gate drive output current setting. This pin is a 7 level input pin set by an external resistor.
INHA	32	32	I	High-side gate driver control input. This pin controls the output of the high-side gate driver.
INHB	34	34	I	High-side gate driver control input. This pin controls the output of the high-side gate driver.
INHC	36	36	I	High-side gate driver control input. This pin controls the output of the high-side gate driver.
INLA	33	33	I	Low-side gate driver control input. This pin controls the output of the low-side gate driver.
INLB	35	35	I	Low-side gate driver control input. This pin controls the output of the low-side gate driver.
INLC	37	37	I	Low-side gate driver control input. This pin controls the output of the low-side gate driver.
MODE	27	—	I	PWM input mode setting. This pin is a 4 level input pin set by an external resistor.
nFAULT	26	26	OD	Fault indicator output. This pin is pulled logic low during a fault condition and requires an external pullup resistor.
nSCS	—	30	I	Serial chip select. A logic low on this pin enables serial interface communication.
SCLK	—	29	I	Serial clock input. Serial data is shifted out and captured on the corresponding rising and falling edge on this pin.
SDI	—	28	I	Serial data input. Data is captured on the falling edge of the SCLK pin.
SDO	—	27	OD	Serial data output. Data is shifted out on the rising edge of the SCLK pin. This pin requires an external pullup resistor.
SHA	7	7	I	High-side source sense input. Connect to the high-side power MOSFET source.
SHB	14	14	I	High-side source sense input. Connect to the high-side power MOSFET source.
SHC	17	17	I	High-side source sense input. Connect to the high-side power MOSFET source.
SNA	10	10	I	Shunt amplifier input. Connect to the low-side of the current shunt resistor.
SNB	11	11	I	Shunt amplifier input. Connect to the low-side of the current shunt resistor.
SNC	20	20	I	Shunt amplifier input. Connect to the low-side of the current shunt resistor.
SOA	23	23	O	Shunt amplifier output.
SOB	22	22	O	Shunt amplifier output.
SOC	21	21	O	Shunt amplifier output.
SPA	9	9	I	Low-side source sense and shunt amplifier input. Connect to the low-side power MOSFET source and high-side of the current shunt resistor.
SPB	12	12	I	Low-side source sense and shunt amplifier input. Connect to the low-side power MOSFET source and high-side of the current shunt resistor.
SPC	19	19	I	Low-side source sense and shunt amplifier input. Connect to the low-side power MOSFET source and high-side of the current shunt resistor.
VCP	5	5	PWR	Charge pump output. Connect a X5R or X7R, 1-μF, 16-V ceramic capacitor between the VCP and VDRAIN pins.
VDRAIN	4	4	I	High-side MOSFET drain sense input and charge pump reference. Connect to the common point of the MOSFET drains.
VDS	29	—	I	VDS monitor trip point setting. This pin is a 7 level input pin set by an external resistor.
VGLS	40	40	PWR	11-V internal regulator output. Connect a X5R or X7R, 1-μF, 16-V ceramic capacitor between the VGLS and GND pins.
VM	3	3	PWR	Gate driver power supply input. Connect to either VDRAIN or separate gate driver supply voltage. Connect a X5R or X7R, 0.1-μF, VM-rated ceramic and greater then or equal to 10-μF local capacitance between the VM and GND pins.
VREF	24	24	PWR	Shunt amplifier power supply input and reference. Connect a X5R or X7R, 0.1-μF, 6.3-V ceramic capacitor between the VREF and AGND pins.

(1) PWR = power, I = input, O = output, NC = no connection, OD = open-drain

7 Specifications

7.1 Absolute Maximum Ratings

at $T_A = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$ (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
GATE DRIVER			
Power supply pin voltage (VM)	-0.3	80	V
Voltage differential between ground pins (AGND, BGND, DGND, PGND)	-0.3	0.3	V
MOSFET drain sense pin voltage (VDRAIN)	-0.3	102	V
MOSFET drain sense pin voltage slew rate (VDRAIN)	0	2	V/ μs
Charge pump pin voltage (CPH, VCP)	-0.3	$V_{\text{VDRAIN}} + 16$	V
Charge-pump negative-switching pin voltage (CPL)	-0.3	V_{VDRAIN}	V
Low-side gate drive regulator pin voltage (VGLS)	-0.3	18	V
Internal logic regulator pin voltage (DVDD)	-0.3	5.75	V
Digital pin voltage (ENABLE, GAIN, IDRIIVE, INHx, INLx, MODE, nFAULT, nSCS, SCLK, SDI, SDO, VDS)	-0.3	5.75	V
Continuous high-side gate drive pin voltage (GHx)	-5 ⁽²⁾	$V_{\text{VCP}} + 0.3$	V
Transient 200-ns high-side gate drive pin voltage (GHx)	-10	$V_{\text{VCP}} + 0.3$	V
High-side gate drive pin voltage with respect to SHx (GHx)	-0.3	16	V
Continuous high-side source sense pin voltage (SHx)	-5 ⁽²⁾	102	V
Continuous high-side source sense pin voltage (SHx)	-5 ⁽²⁾	$V_{\text{VDRAIN}} + 5$	V
Transient 200-ns high-side source sense pin voltage (SHx)	-10	$V_{\text{VDRAIN}} + 10$	V
Continuous low-side gate drive pin voltage (GLx)	-1.0	$V_{\text{VGLS}} + 0.3$	V
Transient 200-ns low-side gate drive pin voltage (GLx)	-5.0	$V_{\text{VGLS}} + 0.3$	V
Gate drive pin source current (GHx, GLx)	Internally limited	Internally limited	A
Gate drive pin sink current (GHx, GLx)	Internally limited	Internally limited	A
Continuous low-side source sense pin voltage (SLx)	-1	1	V
Transient 200-ns low-side source sense pin voltage (SLx)	-5	5	V
Continuous shunt amplifier input pin voltage (SNx, SPx)	-1	1	V
Transient 200-ns shunt amplifier input pin voltage (SNx, SPx)	-5	5	V
Reference input pin voltage (VREF)	-0.3	5.75	V
Shunt amplifier output pin voltage (SOx)	-0.3	$V_{\text{VREF}} + 0.3$	V
Ambient temperature, T_A	-40	125	$^{\circ}\text{C}$
Junction temperature, T_J	-40	150	$^{\circ}\text{C}$
Storage temperature, T_{stg}	-65	150	$^{\circ}\text{C}$

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) VDRAIN pin voltage with respect to high-side gate pin (GHx) and phase node pin voltage (SHx) should be limited to 102 V maximum. This will limit the GHx and SHx pin negative voltage capability when VDRAIN is greater than 92 V.

7.2 ESD Ratings

		VALUE	UNIT
$V_{\text{(ESD)}}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	± 1000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	± 500

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ± 2000 V may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ± 500 V may actually have higher performance.

7.3 Recommended Operating Conditions

at $T_A = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$ (unless otherwise noted)

		MIN	MAX	UNIT
GATE DRIVER				
V_{VM}	Gate driver power supply voltage (VM)	9	75	V
V_{VDRAIN}	Charge pump reference and drain voltage sense (VDRAIN)	7	100	V
V_I	Input voltage (ENABLE, GAIN, IDRIVE, INHx, INLx, MODE, nSCS, SCLK, SDI, VDS)	0	5.5	V
f_{PWM}	Applied PWM signal (INHx, INLx)	0	200 ⁽¹⁾	kHz
t_{SH}	Switch-node slew rate range (SHx)	0	2	V/ns
I_{GATE_HS}	High-side average gate-drive current (GHx)	0	25 ⁽¹⁾	mA
I_{GATE_LS}	Low-side average gate-drive current (GLx)	0	25 ⁽¹⁾	mA
I_{DVDD}	External load current (DVDD)	0	10 ⁽¹⁾	mA
V_{VREF}	Reference voltage input (VREF)	3	5.5	V
I_{SO}	Shunt amplifier output current (SOx)	0	5	mA
V_{OD}	Open drain pullup voltage (nFAULT, SDO)	0	5.5	V
I_{OD}	Open drain output current (nFAULT, SDO)	0	5	mA
T_A	Operating ambient temperature	-40	125	$^{\circ}\text{C}$
T_J	Operating junction temperature	-40	150	$^{\circ}\text{C}$

(1) Power dissipation and thermal limits must be observed.

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DRV8350F	DRV8353F	UNIT
		RTV (WQFN)	RTA (WQFN)	
		32 PINS	40 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	29.2	26.1	$^{\circ}\text{C}/\text{W}$
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	15.2	13.1	$^{\circ}\text{C}/\text{W}$
$R_{\theta JB}$	Junction-to-board thermal resistance	9.2	8.4	$^{\circ}\text{C}/\text{W}$
ψ_{JT}	Junction-to-top characterization parameter	0.1	0.1	$^{\circ}\text{C}/\text{W}$
ψ_{JB}	Junction-to-board characterization parameter	9.2	8.4	$^{\circ}\text{C}/\text{W}$
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	1.2	1.1	$^{\circ}\text{C}/\text{W}$

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Electrical Characteristics

at $T_A = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, $V_{VM} = 9$ to 75 V , $V_{VDRAIN} = 9$ to 100 V , $V_{VIN} = 48\text{ V}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLIES (DVDD, VCP, VGLS, VM)						
I_{VM}	VM operating supply current	$V_{VM} = V_{VDRAIN} = 48\text{ V}$, $\text{ENABLE} = 3.3\text{ V}$, $\text{INHx/INLx} = 0\text{ V}$		8.5	13	mA
I_{VDRAIN}	VDRAIN operating supply current	$V_{VM} = V_{VDRAIN} = 48\text{ V}$, $\text{ENABLE} = 3.3\text{ V}$, $\text{INHx/INLx} = 0\text{ V}$		1.9	4	mA
I_{SLEEP}	Sleep mode supply current	$\text{ENABLE} = 0\text{ V}$, $V_{VM} = V_{VDRAIN} = 48\text{ V}$, $T_A = 25^{\circ}\text{C}$		20	40	μA
		$\text{ENABLE} = 0\text{ V}$, $V_{VM} = V_{VDRAIN} = 48\text{ V}$, $T_A = 125^{\circ}\text{C}$			100	
t_{RST}	Reset pulse time	$\text{ENABLE} = 0\text{ V}$ period to reset faults	5		40	μs
t_{WAKE}	Turnon time	$V_{VM} > V_{UVLO}$, $\text{ENABLE} = 3.3\text{ V}$ to outputs ready			1	ms
t_{SLEEP}	Turnoff time	$\text{ENABLE} = 0\text{ V}$ to device sleep mode			1	ms
V_{DVDD}	DVDD regulator voltage	$I_{DVDD} = 0$ to 10 mA	4.75	5	5.25	V
V_{VCP}	VCP operating voltage with respect to VDRAIN	$V_{VM} = 15\text{ V}$, $I_{VCP} = 0$ to 25 mA	9	10.5	12	V
		$V_{VM} = 12\text{ V}$, $I_{VCP} = 0$ to 20 mA	7.5	10	11.5	
		$V_{VM} = 10\text{ V}$, $I_{VCP} = 0$ to 15 mA	6	8	9.5	
		$V_{VM} = 9\text{ V}$, $I_{VCP} = 0$ to 10 mA	5.5	7.5	8.5	
V_{VGLS}	VGLS operating voltage with respect to GND	$V_{VM} = 15\text{ V}$, $I_{VGLS} = 0$ to 25 mA	13	14.5	16	V
		$V_{VM} = 12\text{ V}$, $I_{VGLS} = 0$ to 20 mA	10	11.5	12.5	

at $T_A = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, $V_{VM} = 9$ to 75 V , $V_{VDRAIN} = 9$ to 100 V , $V_{VIN} = 48\text{ V}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
		V _{VM} = 10 V, I _{VGLS} = 0 to 15 mA	8	9.5	10.5	
		V _{VM} = 9 V, I _{VGLS} = 0 to 10 mA	7	8.5	9.5	
LOGIC-LEVEL INPUTS (ENABLE, INHx, INLx, nSCS, SCLK, SDI)						
V _{IL}	Input logic low voltage		0		0.8	V
V _{IH}	Input logic high voltage		1.5		5.5	V
V _{HYS}	Input logic hysteresis			100		mV
I _{IL}	Input logic low current	V _{VIN} = 0 V	−5		5	μA
I _{IH}	Input logic high current	V _{VIN} = 5 V		50	70	μA
R _{PD}	Pulldown resistance	To GND		100		kΩ
t _{PD}	Propagation delay	INHx/INLx transition to GHx/GLx transition		200		ns
FOUR-LEVEL H/W INPUTS (GAIN, MODE)						
V _{I1}	Input mode 1 voltage	Tied to GND		0		V
V _{COMP1}	Quad-level voltage comparator 1	Voltage comparator between V _{I1} and V _{I2}	1.156	1.256	1.356	V
V _{I2}	Input mode 2 voltage	47 kΩ ± 5% to tied GND		1.9		V

8 Detailed Description

8.1 Overview

The DRV835xF family of devices are integrated 100-V gate drivers for three-phase motor drive applications. These devices decrease system component count, cost, and complexity by integrating three independent half-bridge gate drivers, charge pump and linear regulator for the high-side and low-side gate driver supply voltages, and optional triple current shunt amplifiers. A standard serial peripheral interface (SPI) provides a simple method for configuring the various device settings and reading fault diagnostic information through an external controller. Alternatively, a hardware interface (H/W) option allows for configuring the most commonly used settings through fixed external resistors.

The gate drivers support external N-channel high-side and low-side power MOSFETs and can drive up to 1-A source, 2-A sink peak currents with a 25-mA average output current. The high-side gate drive supply voltage is generated using a doubler charge-pump architecture that regulates the VCP output to $V_{VDRAIN} + 10.5\text{-V}$. The low-side gate drive supply voltage is generated using a linear regulator from the VM power supply that regulates the VGLS output to 14.5-V. The VGLS supply is further regulated to 11-V on the GLx low-side gate driver outputs. A smart gate-drive architecture provides the ability to dynamically adjust the output gate-drive current strength allowing for the gate driver to control the power MOSFET V_{DS} switching speed. This allows for the removal of external gate drive resistors and diodes reducing BOM component count, cost, and PCB area. The architecture also uses an internal state machine to protect against gate-drive short-circuit events, control the half-bridge dead time, and protect against dV/dt parasitic turnon of the external power MOSFET.

The gate drivers can operate in either a single or dual supply architecture. In the single supply architecture, VM can be tied to VDRAIN and is regulated to the correct supply voltages internally. In the dual supply architecture, VM can be connected to a lower voltage supply from a more efficient switching regulator to improve the device efficiency. VDRAIN stays connected to the external MOSFETs to set the correct charge pump and overcurrent monitor reference.

The DRV8353F devices integrate three, bidirectional current-shunt amplifiers for monitoring the current level through each of the external half-bridges using a low-side shunt resistor. The gain setting of the shunt amplifier can be adjusted through the SPI or hardware interface with the SPI providing additional flexibility to adjust the output bias point.

In addition to the high level of device integration, the DRV835xF family of devices provides a wide range of integrated protection features. These features include power-supply undervoltage lockout (UVLO), gate drive undervoltage lockout (GDUV), V_{DS} overcurrent monitoring (OCP), gate-driver short-circuit detection (GDF), and overtemperature shutdown (OTW/OTSD). Fault events are indicated by the nFAULT pin with detailed information available in the SPI registers on the SPI device version.

The DRV835xF family of devices are available in 0.5-mm pin pitch, QFN surface-mount packages. The QFN sizes are 5 × 5 mm for the 32-pin package and 6 × 6 mm for the 40-pin package.

8.3 Feature Description

8.3.1 Three Phase Smart Gate Drivers

The DRV835xF family of devices integrates three, half-bridge gate drivers, each capable of driving high-side and low-side N-channel power MOSFETs. The VCP doubler charge pump provides the correct gate bias voltage to the high-side MOSFET across a wide operating voltage range in addition to providing 100% duty-cycle support. The internal VGLS linear regulator provides the gate-bias voltage for the low-side MOSFETs. The half-bridge gate drivers can be used in combination to drive a three-phase motor or separately to drive other types of loads.

The DRV835xF family of devices implement a smart gate-drive architecture which allows the user to dynamically adjust the gate drive current without requiring external gate current limiting resistors. Additionally, this architecture provides a variety of protection features for the external MOSFETs including automatic dead-time insertion, parasitic dV/dt gate turnon prevention, and gate-fault detection.

8.3.1.1 PWM Control Modes

The DRV835xF family of devices provides four different PWM control modes to support various commutation and control methods. Texas Instruments does not recommend changing the MODE pin or PWM_MODE register during operation of the power MOSFETs. Set all INHx and INLx pins to logic low before making a MODE or PWM_MODE change.

8.3.1.1.1 6x PWM Mode (PWM_MODE = 00b or MODE Pin Tied to AGND)

In this mode, each half-bridge supports three output states: low, high, or high-impedance (Hi-Z). The corresponding INHx and INLx signals control the output state as listed in [Table 8-1](#).

Table 8-1. 6x PWM Mode Truth Table

INLx	INHx	GLx	GHx	SHx
0	0	L	L	Hi-Z
0	1	L	H	H
1	0	H	L	L
1	1	L	L	Hi-Z

8.3.1.1.2 3x PWM Mode (PWM_MODE = 01b or MODE Pin = 47 kΩ to AGND)

In this mode, the INHx pin controls each half-bridge and supports two output states: low or high. The INLx pin is used to change the half-bridge to high impedance. If the high-impedance (Hi-Z) state is not required, tie all INLx pins logic high. The corresponding INHx and INLx signals control the output state as listed in [Table 8-2](#).

Table 8-2. 3x PWM Mode Truth Table

INLx	INHx	GLx	GHx	SHx
0	X	L	L	Hi-Z
1	0	H	L	L
1	1	L	H	H

8.3.1.1.3 1x PWM Mode (PWM_MODE = 10b or MODE Pin = Hi-Z)

In this mode, the DRV835xF family of devices uses 6-step block commutation tables that are stored internally. This feature allows for a three-phase BLDC motor to be controlled using a single PWM sourced from a simple controller. The PWM is applied on the INHA pin and determines the output frequency and duty cycle of the half-bridges.

The half-bridge output states are managed by the INLA, INHB, and INLB pins which are used as state logic inputs. The state inputs can be controlled by an external controller or connected directly to hall sensor digital outputs from the motor (INLA = HALL_A, INHB = HALL_B, INLB = HALL_C). The 1x PWM mode usually operates with synchronous rectification, however it can be configured to use asynchronous diode freewheeling rectification on SPI devices. This configuration is set using the 1PWM_COM bit through the SPI registers.

The INHC input controls the direction through the 6-step commutation table which is used to change the direction of the motor when hall sensors are directly controlling the INLA, INHB, and INLB state inputs. Tie the INHC pin low if this feature is not required.

The INLC input brakes the motor by turning off all high-side MOSFETs and turning on all low-side MOSFETs when it is pulled low. This brake is independent of the states of the other input pins. Tie the INLC pin high if this feature is not required.

Figure 8-6. 1x PWM—Hall Sensor

8.3.1.1.4 Independent PWM Mode (PWM_MODE = 11b or MODE Pin Tied to DVDD)

In this mode, the corresponding input pin independently controls each high-side and low-side gate driver. This control mode allows for the external controller to bypass the internal dead-time handshake of the DRV835xF or to utilize the high-side and low-side drivers to drive separate high-side and low-side loads with each half-bridge. These types of loads include unidirectional brushed DC motors, solenoids, and low-side and high-side switches. In this mode, If the system is configured in a half-bridge configuration, shoot-through occurs when the high-side and low-side MOSFETs are turned on at the same time.

Table 8-5. Independent PWM Mode Truth Table

INLx	INHx	GLx	GHx
0	0	L	L
0	1	L	H
1	0	H	L
1	1	H	H

Because the high-side and low-side V_{DS} overcurrent monitors share the SHx sense line, using both of the monitors is not possible if both the high-side and low-side gate drivers are being operated independently.

In this case, connect the SHx pin to the high-side driver and disable the V_{DS} overcurrent monitors as shown in Figure 8-7.

Figure 8-7. Independent PWM High-Side and Low-Side Drivers

If the half-bridge is used to implement only a high-side or low-side driver, using the V_{DS} overcurrent monitors is still possible. Connect the SHx pin as shown in Figure 8-8 or Figure 8-9. The unused gate driver and the corresponding input can be left disconnected.

Figure 8-8. Single High-Side Driver

Figure 8-9. Single Low-Side Driver

8.3.1.2 Device Interface Modes

The DRV835xF family of devices support two different interface modes (SPI and hardware) to allow the end application to design for either flexibility or simplicity. The two interface modes share the same four pins, allowing the different versions to be pin to pin compatible. This allows for application designers to evaluate with one interface version and potentially switch to another with minimal modifications to their design.

8.3.1.2.1 Serial Peripheral Interface (SPI)

The SPI devices support a serial communication bus that allows for an external controller to send and receive data with the DRV835xF. This allows for the external controller to configure device settings and read detailed fault information. The interface is a four wire interface utilizing the SCLK, SDI, SDO, and nSCS pins.

- The SCLK pin is an input which accepts a clock signal to determine when data is captured and propagated on SDI and SDO.
- The SDI pin is the data input.
- The SDO pin is the data output. The SDO pin uses an open-drain structure and requires an external pullup resistor.
- The nSCS pin is the chip select input. A logic low signal on this pin enables SPI communication with the DRV835xF.

For more information on the SPI, see the [Section 8.5.1](#) section.

8.3.1.2.2 Hardware Interface

Hardware interface devices convert the four SPI pins into four resistor configurable inputs, GAIN, IDRIVE, MODE, and VDS. This allows for the application designer to configure the most commonly used device settings by tying the pin logic high or logic low, or with a simple pullup or pulldown resistor. This removes the requirement for an SPI bus from the external controller. General fault information can still be obtained through the nFAULT pin.

- The GAIN pin configures the current shunt amplifier gain.
- The IDRIVE pin configures the gate drive current strength.
- The MODE pin configures the PWM control mode.
- The VDS pin configures the voltage threshold of the V_{DS} overcurrent monitors.

For more information on the hardware interface, see the [Section 8.3.3](#) section.

Figure 8-10. SPI

Figure 8-11. Hardware Interface

8.3.1.3 Gate Driver Voltage Supplies and Input Supply Configurations

The high-side gate-drive voltage supply is created using a doubler charge pump that operates from the VM and VDRAIN voltage supply inputs. The charge pump allows the gate driver to correctly bias the high-side MOSFET gate with respect to the source across a wide input supply voltage range. The charge pump is regulated to keep a fixed output voltage of $V_{VDRAIN} + 10.5\text{ V}$ and supports an average output current of 25 mA. When V_{VM} is less than 12 V, the charge pump operates in full doubler mode and generates $V_{VCP} = 2 \times V_{VM} - 1.5\text{ V}$ with respect to V_{VDRAIN} when unloaded. The charge pump is continuously monitored for undervoltage to prevent under-driven MOSFET conditions.

The charge pump requires a X5R or X7R, 1- μF , 16-V ceramic capacitor between the VDRAIN and VCP pins to act as the storage capacitor. Additionally, a X5R or X7R, 47-nF, VDRAIN-rated ceramic capacitor is required between the CPH and CPL pins to act as the flying capacitor.

Figure 8-12. Charge Pump Architecture

The low-side gate drive voltage is created using a linear regulator that operates from the VM voltage supply input. The VGLS linear regulator allows the gate driver to correctly bias the low-side MOSFET gate with respect to ground. The VGLS linear regulator output is fixed at 14.5 V and further regulated to 11-V on the GLx outputs during operation. The VGLS regulator supports an output current of 25 mA. The VGLS linear regulator is monitored for undervoltage to prevent under driver MOSFET conditions. The VGLS linear regulator requires a X5R or X7R, 1- μ F, 16-V ceramic capacitor between VGLS and GND.

Since the charge pump output is regulated to $V_{VDRAIN} + 10.5\text{ V}$ this allows for VM to be supplied either directly from the high voltage motor supply (up to 75 V) to support a single supply system or from a low voltage gate driver power supply derived from a switching or linear regulator to improve the device efficiency or utilize an externally available power supply. [Figure 8-13](#) and [Figure 8-14](#) show examples of the DRV835xF configured in either single supply or dual supply configuration.

Figure 8-13. Single Supply Example

Figure 8-14. Dual Supply Example

8.3.1.4 Smart Gate Drive Architecture

The DRV835xF gate drivers use an adjustable, complimentary, push-pull topology for both the high-side and low-side drivers. This topology allows for both a strong pullup and pulldown of the external MOSFET gates.

Additionally, the gate drivers use a smart gate-drive architecture to provide additional control of the external power MOSFETs, take additional steps to protect the MOSFETs, and allow for optimal tradeoffs between efficiency and robustness. This architecture is implemented through two components called IDRIVE and TDRIVE which are detailed in the [Section 8.3.1.4.1](#) section and [Section 8.3.1.4.2](#) section. [Figure 8-15](#) shows the high-level functional block diagram of the gate driver.

The IDRIVE gate-drive current and TDRIVE gate-drive time should be initially selected based on the parameters of the external power MOSFET used in the system and the desired rise and fall times (see the [Section 9](#) section).

The high-side gate driver also implements a Zener clamp diode to help protect the external MOSFET gate from overvoltage conditions in the case of external short-circuit events on the MOSFET.

Figure 8-15. Gate Driver Block Diagram

8.3.1.4.1 IDRIVE: MOSFET Slew-Rate Control

The IDRIVE component implements adjustable gate-drive current to control the MOSFET V_{DS} slew rates. The MOSFET V_{DS} slew rates are a critical factor for optimizing radiated emissions, energy and duration of diode recovery spikes, dV/dt gate turnon leading to shoot-through, and switching voltage transients related to parasitics in the external half-bridge. IDRIVE operates on the principal that the MOSFET V_{DS} slew rates are predominately determined by the rate of gate charge (or gate current) delivered during the MOSFET Q_{GD} or Miller charging region. By allowing the gate driver to adjust the gate current, it can effectively control the slew rate of the external power MOSFETs.

IDRIVE allows the DRV835xF family of devices to dynamically switch between gate drive currents either through a register setting on SPI devices or the IDRIVE pin on hardware interface devices. The SPI devices provide 16 I_{DRIVE} settings ranging between 50-mA to 1-A source and 100-mA to 2-A sink. Hardware interface devices provides 7 I_{DRIVE} settings between the same ranges. The gate drive current setting is delivered to the gate during the turnon and turnoff of the external power MOSFET for the t_{DRIVE} duration. After the MOSFET turnon or turnoff, the gate driver switches to a smaller hold I_{HOLD} current to improve the gate driver efficiency. Additional details on the IDRIVE settings are described in the [Section 8.6](#) section for the SPI devices and in the [Section 8.3.3](#) section for the hardware interface devices.

8.3.1.4.2 TDRIVE: MOSFET Gate Drive Control

The TDRIVE component is an integrated gate-drive state machine that provides automatic dead time insertion through switching handshaking, parasitic dV/dt gate turnon prevention, and MOSFET gate-fault detection.

The first component of the TDRIVE state machine is automatic dead-time insertion. Dead time is period of time between the switching of the external high-side and low-side MOSFETs to make sure that they do not cross conduct and cause shoot-through. The DRV835xF family of devices use V_{GS} voltage monitors to measure the MOSFET gate-to-source voltage and determine the correct time to switch instead of relying on a fixed time value. This feature allows the gate-driver dead time to adjust for variation in the system such a temperature drift and variation in the MOSFET parameters. An additional digital dead time (t_{DEAD}) can be inserted and is adjustable through the registers on SPI devices.

The automatic dead-time insertion has a limitation when the gate driver is transitioning from high-side MOSFET on to low-side MOSFET on when the phase current is coming into the external half-bridge. In this case, the high-side diode will conduct during the dead-time and hold up the switch-node voltage to VDRAIN. In this case, an additional delay of approximately 100-200 ns is introduced into the dead-time handshake. This is introduced due to the need to discharge the voltage present on the internal V_{GS} detection circuit.

The second component focuses on parasitic dV/dt gate turnon prevention. To implement this, the TDRIVE state machine enables a strong pulldown I_{STRONG} current on the opposite MOSFET gate whenever a MOSFET is switching. The strong pulldown last for the TDRIVE duration. This feature helps remove parasitic charge that couples into the MOSFET gate when the half-bridge switch-node voltage slews rapidly.

The third component implements a gate-fault detection scheme to detect pin-to-pin solder defects, a MOSFET gate failure, or a MOSFET gate stuck-high or stuck-low voltage condition. This implementation is done with a pair of V_{GS} gate-to-source voltage monitors for each half-bridge gate driver. When the gate driver receives a command to change the state of the half-bridge it starts to monitor the gate voltage of the external MOSFET. If at the end of the t_{DRIVE} period the V_{GS} voltage has not reached the correct threshold the gate driver will report a fault. To make sure that a false fault is not detected, a t_{DRIVE} time should be selected that is longer than the time required to charge or discharge the MOSFET gate. The t_{DRIVE} time does not increase the PWM time and will terminate if another PWM command is received while active. Additional details on the TDRIVE settings are described in the [Section 8.6](#) section for SPI devices and in the [Section 8.3.3](#) section for hardware interface devices.

Figure 8-16 shows an example of the TDRIVE state machine in operation.

Figure 8-16. TDRIVE State Machine

8.3.1.4.3 Propagation Delay

The propagation delay time (t_{pd}) is measured as the time between an input logic edge to a detected output change. This time has three parts consisting of the digital input deglitcher delay, the digital propagation delay, and the delay through the analog gate drivers.

The input deglitcher prevents high-frequency noise on the input pins from affecting the output state of the gate drivers. To support multiple control modes and dead time insertion, a small digital delay is added as the input command propagates through the device. Lastly, the analog gate drivers have a small delay that contributes to the overall propagation delay of the device.

8.3.1.4.4 MOSFET V_{DS} Monitors

The gate drivers implement adjustable V_{DS} voltage monitors to detect overcurrent or short-circuit conditions on the external power MOSFETs. When the monitored voltage is greater than the V_{DS} trip point (V_{VDS_OCP}) for longer than the deglitch time (t_{OCP}), an overcurrent condition is detected and action is taken according to the device V_{DS} fault mode.

The high-side V_{DS} monitors measure the voltage between the VDRAIN and SHx pins. In devices with three current-shunt amplifiers (DRV8353F), the low-side V_{DS} monitors measure the voltage between the SHx and SPx pins. If the current shunt amplifier is unused, tie the SP pins to the common ground point of the external half-bridges. On device options without the current shunt amplifiers (DRV8350F) the low-side V_{DS} monitor measures between the SHx and SLx pins.

For the SPI devices, the low-side V_{DS} monitor reference point can be changed between the SPx and SNx pins if desired with the LS_REF register setting. This is only for the low-side V_{DS} monitor. The high-side V_{DS} monitor stays between the VDRAIN and SHx pins.

The V_{VDS_OCP} threshold is programmable between 0.06 V and 2 V on SPI device and between 0.06 V and 1 V on hardware interface devices. Additional information on the V_{DS} monitor levels are described in the [Section 8.6](#) section for SPI devices and in the [Section 8.3.3](#) section hardware interface device.

Figure 8-17. DRV8350F V_{DS} Monitors

Figure 8-18. DRV8353F V_{DS} Monitors

8.3.1.4.5 VDRAIN Sense and Reference Pin

The DRV835xF family of devices provides a separate sense and reference pin for the common point of the high-side MOSFET drain. This pin is called VDRAIN. This pin allows the sense line for the overcurrent monitors (VDRAIN) and the power supply (VM) to stay separate and prevent noise on the VDRAIN sense line.

The VDRAIN pin serves as the reference point for the integrated charge pump. This makes sure that the charge pump reference stays with respect to the power MOSFET supply through voltage transient conditions.

Since the charge pump is referenced to VDRAIN, this also allows for VM to be supplied either directly from the power MOSFET supply (VDRAIN) or from an independent supply. This allows for a configuration where VM can be supplied from an efficient low voltage supply to increase the device efficiency.

8.3.2 DVDD Linear Voltage Regulator

A 5-V, 10-mA linear regulator is integrated into the DRV835xF family of devices and is available for use by external circuitry. This regulator can provide the supply voltage for low-current supporting circuitry. The output of the DVDD regulator should be bypassed near the DVDD pin with a X5R or X7R, 1- μ F, 6.3-V ceramic capacitor routed directly back to the adjacent DGND or GND ground pin.

The DVDD nominal, no-load output voltage is 5 V. When the DVDD load current exceeds 10 mA, the regulator functions like a constant-current source. The output voltage drops significantly with a current load greater than 10 mA.

Figure 8-19. DVDD Linear Regulator Block Diagram

Use Equation 1 to calculate the power dissipated in the device because of the DVDD linear regulator.

$$P = (V_{VM} - V_{DVDD}) \times I_{DVDD} \quad (1)$$

For example, at $V_{VM} = 24$ V, drawing 20 mA out of DVDD results in a power dissipation as shown in Equation 2.

$$P = (24 \text{ V} - 3.3 \text{ V}) \times 20 \text{ mA} = 414 \text{ mW} \quad (2)$$

8.3.3 Pin Diagrams

Figure 8-20 shows the input structure for the logic-level pins, INHx, INLx, ENABLE, nSCS, SCLK, and SDI.

Figure 8-20. Logic-Level Input Pin Structure

Figure 8-21 shows the structure of the four level input pins, MODE and GAIN, on hardware interface devices. The input can be set with an external resistor.

Figure 8-21. Four Level Input Pin Structure

Figure 8-22 shows the structure of the seven level input pins, IDRIIVE and VDS, on hardware interface devices. The input can be set with an external resistor.

Figure 8-22. Seven Level Input Pin Structure

Figure 8-23 shows the structure of the open-drain output pins nFAULT and SDO. The open-drain output requires an external pullup resistor to function correctly.

Figure 8-23. Open-Drain Output Pin Structure

8.3.4 Low-Side Current-Shunt Amplifiers (DRV8353F)

The DRV8353F integrate three, high-performance low-side current-shunt amplifiers for current measurements using low-side shunt resistors in the external half-bridges. Low-side current measurements are commonly used to implement overcurrent protection, external torque control, or brushless DC commutation with the external controller. All three amplifiers can be used to sense the current in each of the half-bridge legs or one amplifier can be used to sense the sum of the half-bridge legs. The current shunt amplifiers include features such as programmable gain, offset calibration, unidirectional and bidirectional support, and a voltage reference pin (VREF).

8.3.4.1 Bidirectional Current Sense Operation

The SOx pin on the DRV8353F outputs an analog voltage equal to the voltage across the SPx and SNx pins multiplied by the gain setting (G_{CSA}). The gain setting is adjustable between four different levels (5 V/V, 10 V/V, 20 V/V, and 40 V/V). Use Equation 3 to calculate the current through the shunt resistor.

$$I = \frac{\frac{V_{VREF} - V_{SOx}}{2}}{G_{CSA} \times R_{SENSE}} \quad (3)$$

Figure 8-24. Bidirectional Current-Sense Configuration

Figure 8-25. Bidirectional Current-Sense Output

Figure 8-26. Bidirectional Current Sense Regions

8.3.4.2 Unidirectional Current Sense Operation (SPI only)

On the DRV8353F SPI devices, use the VREF_DIV bit to remove the VREF divider. In this case the shunt amplifier operates unidirectionally and SOx outputs an analog voltage equal to the voltage across the SPx and SNx pins multiplied by the gain setting (G_{CSA}). Use Equation 4 to calculate the current through the shunt resistor.

$$I = \frac{V_{VREF} - V_{SOx}}{G_{CSA} \times R_{SENSE}} \quad (4)$$

Figure 8-27. Unidirectional Current-Sense Configuration

Figure 8-28. Unidirectional Current-Sense Output

Figure 8-29. Unidirectional Current-Sense Regions

8.3.4.3 Amplifier Calibration Modes

To minimize DC offset and drift over temperature, a DC calibration mode is provided and enabled through the SPI register (CSA_CAL_X). This option is not available on hardware interface devices. When the calibration setting is enabled the inputs to the amplifier are shorted and the load is disconnected. DC calibration can be done at any time, even when the half-bridges are operating. For the best results, do the DC calibration during the switching OFF period to decrease the potential noise impact to the amplifier. A diagram of the calibration mode is shown below. When a CSA_CAL_X bit is enabled, the corresponding amplifier goes to the calibration mode.

Figure 8-30. Amplifier Manual Calibration

In addition to the manual calibration method provided on the SPI devices versions, the DRV835xF family of devices provide an auto calibration feature on both the hardware and SPI device versions in order to minimize the amplifier input offset after power up and during run time to account for temperature and device variation.

Auto calibration occurs automatically on device power up for both the hardware and SPI device options. The power up auto calibration starts immediately after the VREF pin crosses the minimum operational VREF voltage. 50 μ s should be allowed for the power up auto calibration routine to complete after the VREF pin voltage crosses

the minimum VREF operational voltage. The auto calibration functions by doing a trim routine of the amplifier to minimize the amplifier input offset. After this the amplifiers are ready for normal operation.

For the SPI device options, auto calibration can also be done again during run time by enabling the AUTO_CAL register setting. Auto calibration can then be commanded with the corresponding CSA_CAL_X register setting to rerun the auto calibration routine. During auto calibration all of the amplifiers will be configured for the max gain setting in order to improve the accuracy of the calibration routine.

8.3.4.4 MOSFET V_{DS} Sense Mode (SPI Only)

The current-sense amplifiers on the DRV8353F SPI devices can be configured to amplify the voltage across the external low-side MOSFET V_{DS} . This allows for the external controller to measure the voltage drop across the MOSFET $R_{DS(on)}$ without the shunt resistor and then calculate the half-bridge current level.

To enable this mode set the CSA_FET bit to 1. The positive input of the amplifier is then internally connected to the SHx pin with an internal clamp to prevent high voltage on the SHx pin from damaging the sense amplifier inputs. During this mode of operation, the SPx pins should stay connected to the source of the low-side MOSFET as it serves as the reference for the low-side gate driver. When the CSA_FET bit is set to 1, the negative reference for the low-side V_{DS} monitor is automatically set to SNx, regardless of the state of the LS_REF bit state. This setting is implemented to prevent disabling of the low-side V_{DS} monitor.

If the system operates in MOSFET V_{DS} sensing mode, route the SHx and SNx pins with Kelvin connections across the drain and source of the external low-side MOSFETs.

Figure 8-31. Resistor Sense Configuration

Figure 8-32. V_{DS} Sense Configuration

When operating in MOSFET V_{DS} sense mode, the amplifier is enabled at the end of the t_{DRIVE} time. At this time, the amplifier input is connected to the SHx pin, and the SOx output is valid. When the low-side MOSFET receives a signal to turn off, the amplifier inputs, SPx and SNx, are shorted together internally.

8.3.5 Gate Driver Protective Circuits

The DRV835xF family of devices are fully protected against VM undervoltage, charge pump and low-side regulator undervoltage, MOSFET V_{DS} overcurrent, gate driver shorts, and overtemperature events.

8.3.5.1 VM Supply and VDRAIN Undervoltage Lockout (UVLO)

If at any time the input supply voltage on the VM pin falls below the V_{VM_UV} threshold or voltage on VDRAIN pin falls below the V_{VDR_UV} , all of the external MOSFETs are disabled, the charge pump is disabled, and the nFAULT pin is driven low. The FAULT and UVLO bits are also latched high in the registers on SPI devices. Normal operation continues (gate driver operation and the nFAULT pin is released) when the undervoltage condition is removed. The UVLO bit stays set until cleared through the CLR_FLT bit or an ENABLE pin reset pulse (t_{RST}).

VM supply or VDRAIN undervoltage may also lead to VCP charge pump or VGLS regulator undervoltage conditions to report. This behavior is expected because the VCP and VGLS supply voltages are dependent on VM and VDRAIN pin voltages.

8.3.5.2 VCP Charge-Pump and VGLS Regulator Undervoltage Lockout (GDUV)

If at any time the voltage on the VCP pin (charge pump) falls below the V_{VCP_UV} threshold or voltage on the VGLS pin falls below the V_{VGLS_UV} threshold, all of the external MOSFETs are disabled and the nFAULT pin is driven low. The FAULT and GDUV bits are also latched high in the registers on SPI devices. Normal operation continues (gate-driver operation and the nFAULT pin is released) when the undervoltage condition is removed.

The GDUV bit stays set until cleared through the CLR_FLT bit or an ENABLE pin reset pulse (t_{RST}). Setting the DIS_GDUV bit high on the SPI devices disables this protection feature. On hardware interface devices, the GDUV protection is always enabled.

8.3.5.3 MOSFET V_{DS} Overcurrent Protection (V_{DS_OCP})

A MOSFET overcurrent event is sensed by monitoring the V_{DS} voltage drop across the external MOSFET $R_{DS(on)}$. If the voltage across an enabled MOSFET exceeds the V_{VDS_OCP} threshold for longer than the t_{OCP_DEG} deglitch time, a V_{DS_OCP} event is recognized and action is done according to the OCP_MODE . On hardware interface devices, the V_{VDS_OCP} threshold is set with the VDS pin, the t_{OCP_DEG} is fixed at 4 μs , and the OCP_MODE is configured for 8-ms automatic retry but can be disabled by tying the VDS pin to DVDD. On SPI devices, the V_{VDS_OCP} threshold is set through the VDS_LVL SPI register, the t_{OCP_DEG} is set through the OCP_DEG SPI register, and the OCP_MODE bit can operate in four different modes: V_{DS} latched shutdown, V_{DS} automatic retry, V_{DS} report only, and V_{DS} disabled.

The MOSFET V_{DS} overcurrent protection operates in cycle-by-cycle (CBC) mode by default. This can be disabled on SPI device variants through the SPI registers. When in cycle-by-cycle (CBC) mode a new rising edge on the PWM inputs will clear an existing overcurrent fault.

Additionally, on SPI devices the OCP_ACT register setting can be set to change the V_{DS_OCP} overcurrent response between linked and individual shutdown modes. When OCP_ACT is 0, a V_{DS_OCP} fault will only effect the half-bridge in which it occurred. When OCP_ACT is 1, all three half-bridges will respond to a V_{DS_OCP} fault on any of the other half-bridges. OCP_ACT defaults to 0, individual shutdown mode.

8.3.5.3.1 V_{DS} Latched Shutdown ($OCP_MODE = 00b$)

After a V_{DS_OCP} event in this mode, all the external MOSFETs are disabled and the nFAULT pin is driven low. The FAULT, V_{DS_OCP} , and corresponding MOSFET OCP bits are latched high in the SPI registers. Normal operation continues (gate driver operation and the nFAULT pin is released) when the V_{DS_OCP} condition is removed and a clear faults command is issued either through the CLR_FLT bit or an ENABLE reset pulse (t_{RST}).

8.3.5.3.2 V_{DS} Automatic Retry ($OCP_MODE = 01b$)

After a V_{DS_OCP} event in this mode, all the external MOSFETs are disabled and the nFAULT pin is driven low. The FAULT, V_{DS_OCP} , and corresponding MOSFET OCP bits are latched high in the SPI registers. Normal operation continues automatically (gate driver operation and the nFAULT pin is released) after the t_{RETRY} time elapses. The FAULT, V_{DS_OCP} , and MOSFET OCP bits stay latched until the t_{RETRY} period expires.

8.3.5.3.3 V_{DS} Report Only ($OCP_MODE = 10b$)

No protective action occurs after a V_{DS_OCP} event in this mode. The overcurrent event is reported by driving the nFAULT pin low and latching the FAULT, V_{DS_OCP} , and corresponding MOSFET OCP bits high in the SPI registers. The gate drivers continue to operate as normal. The external controller manages the overcurrent condition by acting appropriately. The reporting clears (nFAULT pin is released) when the V_{DS_OCP} condition is removed and a clear faults command is issued either through the CLR_FLT bit or an ENABLE reset pulse (t_{RST}).

8.3.5.3.4 V_{DS} Disabled ($OCP_MODE = 11b$)

No action occurs after a V_{DS_OCP} event in this mode.

8.3.5.4 V_{SENSE} Overcurrent Protection (SEN_OCP)

Half-bridge overcurrent is also monitored by sensing the voltage drop across the external current-sense resistor with the SP pin. If at any time, the voltage on the SP input of the current-sense amplifier exceeds the V_{SEN_OCP} threshold for longer than the t_{OCP_DEG} deglitch time, a SEN_OCP event is recognized and action is done according to the OCP_MODE . On hardware interface devices, the V_{SENSE} threshold is fixed at 1 V, t_{OCP_DEG} is fixed at 4 μs , and the OCP_MODE for V_{SENSE} is fixed for 8-ms automatic retry. On SPI devices, the V_{SENSE} threshold is set through the SEN_LVL SPI register, the t_{OCP_DEG} is set through the OCP_DEG SPI register, and the OCP_MODE bit can operate in four different modes: V_{SENSE} latched shutdown, V_{SENSE} automatic retry, V_{SENSE} report only, and V_{SENSE} disabled.

The V_{SENSE} overcurrent protection operates in cycle-by-cycle (CBC) mode by default. This can be disabled on SPI device variants through the SPI registers. When in cycle-by-cycle (CBC) mode a new rising edge on the PWM inputs will clear an existing overcurrent fault.

Additionally, on SPI devices the OCP_ACT register setting can be set to change the SEN_OCP overcurrent response between linked and individual shutdown modes. When OCP_ACT is 0, a SEN_OCP fault will only effect the half-bridge in which it occurred. When OCP_ACT is 1, all three half-bridges will respond to a SEN_OCP fault on any of the other half-bridges. OCP_ACT defaults to 0, individual shutdown mode.

8.3.5.4.1 V_{SENSE} Latched Shutdown (OCP_MODE = 00b)

After a SEN_OCP event in this mode, all the external MOSFETs are disabled and the nFAULT pin is driven low. The FAULT and SEN_OCP bits are latched high in the SPI registers. Normal operation continues (gate driver operation and the nFAULT pin is released) when the SEN_OCP condition is removed and a clear faults command is issued either through the CLR_FLT bit or an ENABLE reset pulse (t_{RST}).

8.3.5.4.2 V_{SENSE} Automatic Retry (OCP_MODE = 01b)

After a SEN_OCP event in this mode, all the external MOSFETs are disabled and the nFAULT pin is driven low. The FAULT, SEN_OCP, and corresponding sense OCP bits are latched high in the SPI registers. Normal operation continues automatically (gate driver operation and the nFAULT pin is released) after the t_{RETRY} time elapses. The FAULT, SEN_OCP, and sense OCP bits stay latched until the t_{RETRY} period expires.

8.3.5.4.3 V_{SENSE} Report Only (OCP_MODE = 10b)

No protective action occurs after a SEN_OCP event in this mode. The overcurrent event is reported by driving the nFAULT pin low and latching the FAULT and SEN_OCP bits high in the SPI registers. The gate drivers continue to operate. The external controller manages the overcurrent condition by acting appropriately. The reporting clears (nFAULT released) when the SEN_OCP condition is removed and a clear faults command is issued either through the CLR_FLT bit or an ENABLE reset pulse (t_{RST}).

8.3.5.4.4 V_{SENSE} Disabled (OCP_MODE = 11b or DIS_SEN = 1b)

No action occurs after a SEN_OCP event in this mode. The SEN_OCP bit can be disabled independently of the VDS_OCP bit by using the DIS_SEN SPI register.

8.3.5.5 Gate Driver Fault (GDF)

The GHx and GLx pins are monitored such that if the voltage on the external MOSFET gate does not increase or decrease after the t_{DRIVE} time, a gate driver fault is detected. This fault may be encountered if the GHx or GLx pins are shorted to the PGND, SHx, or VM pins. Additionally, a gate driver fault may be encountered if the selected I_{DRIVE} setting is not sufficient to turn on the external MOSFET within the t_{DRIVE} period. After a gate drive fault is detected, all external MOSFETs are disabled and the nFAULT pin driven low. In addition, the FAULT, GDF, and corresponding VGS bits are latched high in the SPI registers. Normal operation continues (gate driver operation and the nFAULT pin is released) when the gate driver fault condition is removed and a clear faults command is issued either through the CLR_FLT bit or an ENABLE reset pulse (t_{RST}). On SPI devices, setting the DIS_GDF_UVLO bit high disables this protection feature.

Gate driver faults can indicate that the selected I_{DRIVE} or t_{DRIVE} settings are too low to slew the external MOSFET in the desired time. Increasing either the I_{DRIVE} or t_{DRIVE} setting can resolve gate driver faults in these cases. Alternatively, if a gate-to-source short occurs on the external MOSFET, a gate driver fault is reported because of the MOSFET gate not turning on.

8.3.5.6 Overcurrent Soft Shutdown (OCP Soft)

In the case of a MOSFET V_{DS} or V_{SENSE} overcurrent fault the driver uses a special shutdown sequence to protect the driver and MOSFETs from large voltage switching transients. These large voltage transients can be created when rapidly switching off the external MOSFETs when a large drain to source current is present, such as during an overcurrent event.

To mitigate this issue, the DRV835xF family of devices reduce the I_{DRIVEN} pull down current setting for both the high-side and low-side gate drivers during the MOSFET turn off in response to the fault event. If the programmed

I_{DRIVEN} value is less than 1100 mA, the I_{DRIVEN} value is set to the minimum I_{DRIVEN} setting. If the programmed I_{DRIVEN} value is greater than or equal to 1100mA, the I_{DRIVEN} value is reduced by seven code settings.

8.3.5.7 Thermal Warning (OTW)

If the die temperature exceeds the trip point of the thermal warning (T_{OTW}), the OTW bit is set in the registers of SPI devices. The device does no additional action and continues to function. When the die temperature falls below the hysteresis point of the thermal warning, the OTW bit clears automatically. The OTW bit can also be configured to report on the nFAULT pin and FAULT bit by setting the OTW_REP bit to 1 through the SPI registers.

8.3.5.8 Thermal Shutdown (OTSD)

If the die temperature exceeds the trip point of the thermal shutdown limit (T_{OTSD}), all the external MOSFETs are disabled, the charge pump is shut down, and the nFAULT pin is driven low. In addition, the FAULT and TSD bits are latched high. Normal operation continues (gate driver operation and the nFAULT pin is released) when the overtemperature condition is removed. The TSD bit stays latched high indicating that a thermal event occurred until a clear fault command is issued either through the CLR_FLT bit or an ENABLE reset pulse (t_{RST}). This protection feature cannot be disabled.

8.3.5.9 Fault Response Table

Table 8-6. Fault Action and Response

FAULT	CONDITION	CONFIGURATION	REPORT	GATE DRIVER	RECOVERY
VM Undervoltage (VM_UV)	$V_{VM} < V_{VM_UV}$	—	nFAULT	Hi-Z	Automatic: $V_{VM} > V_{VM_UV}$
VDRAIN Undervoltage (VDR_UV)	$V_{VDRAIN} < V_{VDR_UV}$	—	nFAULT	Hi-Z	Automatic: $V_{VM} > V_{VDR_UV}$
Charge Pump Undervoltage (VCP_UV)	$V_{VCP} < V_{VCP_UV}$	DIS_GDUV = 0b	nFAULT	Hi-Z	Automatic: $V_{VCP} > V_{VCP_UV}$
		DIS_GDUV = 1b	None	Active	
VGLS Regulator Undervoltage (VGLS_UV)	$V_{VGLS} < V_{VGLS_UV}$	DIS_GDUV = 0b	nFAULT	Hi-Z	Automatic: $V_{VGLS} > V_{VGLS_UV}$
		DIS_GDUV = 1b	None	Active	
V_{DS} Overcurrent (VDS_OCP)	$V_{DS} > V_{VDS_OCP}$	OCP_MODE = 00b	nFAULT	Hi-Z	Latched: CLR_FLT, ENABLE Pulse
		OCP_MODE = 01b	nFAULT	Hi-Z	Retry: t_{RETRY}
		OCP_MODE = 10b	nFAULT	Active	No action
		OCP_MODE = 11b	None	Active	No action
V_{SENSE} Overcurrent (SEN_OCP)	$V_{SP} > V_{SEN_OCP}$	OCP_MODE = 00b	nFAULT	Hi-Z	Latched: CLR_FLT, ENABLE Pulse
		OCP_MODE = 01b	nFAULT	Hi-Z	Retry: t_{RETRY}
		OCP_MODE = 10b	nFAULT	Active	No action
		OCP_MODE = 11b or DIS_SEN = 1b	None	Active	No action
Gate Driver Fault (GDF)	V_{GS} Stuck > I_{DRIVE}	DIS_GDF = 0b	nFAULT	Hi-Z	Latched: CLR_FLT, ENABLE Pulse
		DIS_GDF = 1b	None	Active	No action
Thermal Warning (OTW)	$T_J > T_{OTW}$	OTW_REP = 1b	nFAULT	Active	Automatic: $T_J < T_{OTW} - T_{HYS}$
		OTW_REP = 0b	None	Active	No action
Thermal Shutdown (OTSD)	$T_J > T_{OTSD}$	—	nFAULT	Hi-Z	Automatic: $T_J < T_{OTSD} - T_{HYS}$

8.4 Device Functional Modes

8.4.1 Gate Driver Functional Modes

8.4.1.1 Sleep Mode

The ENABLE pin manages the state of the DRV835xF family of devices. When the ENABLE pin is low, the device goes to a low-power sleep mode. In sleep mode, all gate drivers are disabled, all external MOSFETs are disabled, the VCP charge pump and VGLS regulator are disabled, the DVDD regulator is disabled, the sense amplifiers are disabled, and the SPI bus is disabled. In sleep mode all the device registers will reset to their default values. The t_{SLEEP} time must elapse after a falling edge on the ENABLE pin before the device goes to

sleep mode. The device comes out of sleep mode automatically if the ENABLE pin is pulled high. The t_{WAKE} time must elapse before the device is ready for inputs.

In sleep mode and when $V_{VM} < V_{UVLO}$, all external MOSFETs are disabled. The high-side gate pins, GHx, are pulled to the SHx pin by an internal resistor and the low-side gate pins, GLx, are pulled to the PGND pin by an internal resistor.

8.4.1.2 Operating Mode

When the ENABLE pin is high and $V_{VM} > V_{UVLO}$, the device goes to operating mode. The t_{WAKE} time must elapse before the device is ready for inputs. In this mode the charge pump, low-side gate regulator, DVDD regulator, and SPI bus are active

8.4.1.3 Fault Reset (CLR_FLT or ENABLE Reset Pulse)

In the case of device latched faults, the DRV835xF family of devices goes to a partial shutdown state to help protect the external power MOSFETs and system.

When the fault condition has been removed the device can reenter the operating state by either setting the CLR_FLT SPI bit on SPI devices or issuing a reset pulse to the ENABLE pin on either interface variant. The ENABLE reset pulse (t_{RST}) consists of a high-to-low-to-high transition on the ENABLE pin. The low period of the sequence should fall with the t_{RST} time window or else the device will start the complete shutdown sequence. The reset pulse has no effect on any of the regulators, device settings, or other functional blocks

8.5 Programming

This section applies only to the DRV835xF SPI devices.

8.5.1 SPI Communication

8.5.1.1 SPI

On DRV835xF SPI devices, an SPI bus is used to set device configurations, operating parameters, and read out diagnostic information. The SPI operates in slave mode and connects to a master controller. The SPI input data (SDI) word consists of a 16 bit word, with a 5 bit command and 11 bits of data. The SPI output data (SDO) word consists of 11-bit register data. The first 5 bits are don't care bits.

A valid frame must meet the following conditions:

- The SCLK pin should be low when the nSCS pin transitions from high to low and from low to high.
- The nSCS pin should be pulled high for at least 400 ns between words.
- When the nSCS pin is pulled high, any signals at the SCLK and SDI pins are ignored and the SDO pin is set Hi-Z.
- Data is captured on the falling edge of SCLK and data is propagated on the rising edge of SCLK.
- The most significant bit (MSB) is shifted in and out first.
- A full 16 SCLK cycles must occur for transaction to be valid.
- If the data word sent to the SDI pin is not 16 bits, a frame error occurs and the data word is ignored.
- For a write command, the existing data in the register being written to is shifted out on the SDO pin following the 5 bit command data.
- The SDO pin is an open-drain output and requires an external pullup resistor.

8.5.1.1.1 SPI Format

The SDI input data word is 16 bits long and consists of the following format:

- 1 read or write bit, W (bit B15)
- 4 address bits, A (bits B14 through B11)
- 11 data bits, D (bits B11 through B0)

Set the read/write bit (W0, B15) to 0b for a write command. Set the read/write bit (W0, B15) to 1b for a read command.

The SDO output data word is 16 bits long and the first 5 bits are don't care bits. The response word is the data currently in the register being accessed.

Table 8-7. SDI Input Data Word Format

R/W	ADDRESS					DATA									
B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0

8.6 Register Maps

This section applies only to the DRV835xF SPI devices.

Note

Do not modify reserved registers or addresses not listed in the register maps. Writing to these registers may have unintended effects. For all reserved bits, the default value is 0. To help prevent erroneous SPI writes from the master controller, set the LOCK bits to lock the SPI registers.

8.6.1 Status Registers

The status registers are used to reporting warning and fault conditions. The status registers are read-only registers

Complex bit access types are encoded to fit into small table cells. [Table 8-10](#) shows the codes that are used for access types in this section.

Table 8-10. Status Registers Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Reset or Default Value		
-n		Value after reset or the default value

8.6.1.1 Fault Status Register 1 (address = 0x00h)

The fault status register 1 is shown in [Figure 8-34](#) and described in [Table 8-11](#).

Register access type: Read only

Figure 8-34. Fault Status Register 1

10	9	8	7	6	5	4	3	2	1	0
FAULT	VDS_OCP	GDF	UVLO	OTSD	VDS_HA	VDS_LA	VDS_HB	VDS_LB	VDS_HC	VDS_LC

Table 8-12. Fault Status Register 2 Field Descriptions

Bit	Field	Type	Default	Description
10	SA_OC	R	0b	Indicates overcurrent on phase A sense amplifier (DRV8353xS-Q1)
9	SB_OC	R	0b	Indicates overcurrent on phase B sense amplifier (DRV8353xS-Q1)
8	SC_OC	R	0b	Indicates overcurrent on phase C sense amplifier (DRV8353xS-Q1)
7	OTW	R	0b	Indicates overtemperature warning
6	GDUV	R	0b	Indicates VCP charge pump and/or VGLS undervoltage fault condition
5	VGS_HA	R	0b	Indicates gate drive fault on the A high-side MOSFET
4	VGS_LA	R	0b	Indicates gate drive fault on the A low-side MOSFET
3	VGS_HB	R	0b	Indicates gate drive fault on the B high-side MOSFET
2	VGS_LB	R	0b	Indicates gate drive fault on the B low-side MOSFET
1	VGS_HC	R	0b	Indicates gate drive fault on the C high-side MOSFET
0	VGS_LC	R	0b	Indicates gate drive fault on the C low-side MOSFET

8.6.2 Control Registers

The control registers are used to configure the device. The control registers are read and write capable

Complex bit access types are encoded to fit into small table cells. [Table 8-13](#) shows the codes that are used for access types in this section.

Table 8-13. Control Registers Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The DRV835xF family of devices are primarily used in three-phase brushless DC motor control applications. The design procedures in the [Section 9.2](#) section highlight how to use and configure the DRV835xF family of devices.

9.2 Typical Application

9.2.1 Primary Application

The DRV8353F is shown being used for a single supply, three-phase BLDC motor drive with individual half-bridge current sense in this application example.

9.2.1.1 Design Requirements

Table 9-1 lists the example input parameters for the system design.

Table 9-1. Design Parameters

EXAMPLE DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
Power supply voltage	$V_{VM}, V_{VDRAIN}, V_{VIN}$	48 V
MOSFET part number	MOSFET	CSD19535KCS
MOSFET total gate charge	Q_g	78 nC (typical) at $V_{GS} = 10$ V
MOSFET gate to drain charge	Q_{gd}	13 nC (typical)
Target output rise time	t_r	100 to 300 ns
Target output fall time	t_f	50 to 150 ns
PWM frequency	f_{PWM}	45 kHz
Maximum motor current	I_{max}	100 A
ADC reference voltage	V_{VREF}	3.3 V
Winding sense current range	I	

$$\text{Trapezoidal 120° Commutation: } I_{VCP/VGLS} > Q_g \times f_{PWM} \quad (5)$$

$$\text{Sinusoidal 180° Commutation: } I_{VCP/VGLS} > 3 \times Q_g \times f_{PWM} \quad (6)$$

where

- f_{PWM} is the maximum desired PWM switching frequency.
- Q_g is the MOSFET total gate charge
- $I_{VCP/VGLS}$ is the charge pump or low-side regulator capacity, dependent on the VM pin voltage.
- The MOSFET multiplier based on the commutation control method, may vary based on implementation.

9.2.1.2.1.1 MOSFET Example

If a system is using $V_{VM} = 48 \text{ V}$ ($I_{VCP} = 25 \text{ mA}$) and a maximum PWM switching frequency of 45 kHz, then the VCP charge-pump and VGLS regulator can support MOSFETs using trapezoidal commutation with a $Q_g < 556 \text{ nC$

$$I_{\text{DRIVEN2}} = \frac{13 \text{ nC}}{150 \text{ ns}} = 87 \text{ mA} \quad (12)$$

Select a value for I_{DRIVEN} that is between 87 mA and 260 mA. For this example, the value of I_{DRIVEN} was selected as 200-mA sink.

9.2.1.2.3 V_{DS} Overcurrent Monitor Configuration

The V_{DS} monitors are configured based on the worst-case motor current and the $R_{\text{DS(on)}}$ of the external MOSFETs as shown in Equation 13.

$$V_{\text{DS_OCP}} > I_{\text{max}} \times R_{\text{DS(on)max}} \quad (13)$$

9.2.1.2.3.1 V_{DS} Overcurrent Example

$$R = \frac{1.4 \text{ V}}{A_V \times 40 \text{ A}} \quad 2 \text{ W} > 28.3^2 \times R \rightarrow R < 2.5 \text{ m}\Omega \quad (18)$$

$$2.5 \text{ m}\Omega > \frac{1.4 \text{ V}}{A_V \times 40 \text{ A}} \rightarrow A_V > 14 \quad (19)$$

Therefore, the gain setting must be selected as 20 V/V or 40 V/V and the value of the sense resistor must be less than 2.5 mΩ to meet the power requirement for the sense resistor. For this example, the gain setting was selected as 20 V/V. The value of the resistor and worst case current can be verified that $R < 2.5 \text{ m}\Omega$ and $I_{\text{max}} = 40 \text{ A}$ does not violate the differential range specification of the sense amplifier input (V_{SPxD}).

9.2.1.2.5 Single Supply Power Dissipation

Design care must be taken to make sure that the thermal ratings of the DRV835xF are not violated during normal operation of the device. This is especially critical in higher voltage and higher ambient operation applications where power dissipation or the device ambient temperature are increased.

$$P_{VCP} = 10.5 \text{ mA} \times (48 \text{ V} + 48 \text{ V}) = 1 \text{ W} \quad (26)$$

$$P_{VGLS} = 10.5 \text{ mA} \times 48 \text{ V} = 0.5 \text{ W} \quad (27)$$

$$P_{VM} = 9.5 \text{ mA} \times 48 \text{ V} = 0.5 \text{ W} \quad (28)$$

$$P_{tot} = 1 \text{ W} + 0.5 \text{ W} + 0.5 \text{ W} = 2.0 \text{ W} \quad (29)$$

Lastly, to estimate the device junction temperature during operation, use Equation 24 to calculate the value of T_{Jmax} for $T_{Amax} = 60^\circ\text{C}$, $R_{\theta JA} = 26.1^\circ\text{C/W}$ for the RTA package, and $P_{tot} = 2.054 \text{ W}$. Again, please note that the $R_{\theta JA}$ is highly dependent on the PCB design used in the actual application and should be verified. For more information about traditional and new thermal metrics, see the [Semiconductor](#)

Figure 9-6. IDRIVE 300-mA and 600-mA Setting Positive Current

Figure 9-7. IDRIVE 300-m

9.2.2 Alternative Application

In this application, the DRV8353F is configured to use one sense amplifier in unidirectional mode for a summing current sense scheme often used in trapezoidal or hall-based BLDC commutation control. Additionally, the device is configured in dual supply mode using an external buck regulator for the VM gate drive voltage supply to decrease internal power dissipation.

9.2.2.1 Design Requirements

Table 9-3 lists the example design input parameters for system design.

Table 9-3. Design Parameters

EXAMPLE DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
Power supply voltage	V_{VM} </	

PACKAGING INFORMATION

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

⁽²⁾ **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
