

具有 8 位模拟和 8/16 位 PWM 调光的 LP5860 11 × 18 LED 矩阵驱动器

1 特性

- LED 矩阵拓扑：
 - 18 个恒定电流阱，具有 11 个扫描开关，可实现 198 个 LED 点
 - 可针对 1 至 11 个扫描开关进行配置
- 工作电压范围：
 - V_{CC}/V_{LED} 范围：2.7V 至 5.5V
 - 逻辑引脚兼容 1.8V、3.3V 和 5V 电压
- 18 个高精度恒定电流阱：
 - 当 $V_{CC} \geq 3.3V$ 时每个电流阱的电流为 0.1mA - 50mA
 - 器件间误差：当通道电流 = 50mA 时为 $\pm 3\%$
 - 通道间误差：当通道电流 = 50mA 时为 $\pm 3\%$
 - 相移可平衡瞬态功耗
- 超低功耗：
 - 关断模式：当 EN 为低电平时 $I_{CC} \leq 1\mu A$
 - 待机模式：当 EN 为高电平且 CHIP_EN 为 0 (保留数据) 时 $I_{CC} \leq 10\mu A$
 - 工作模式：当通道电流为 5mA 时 $I_{CC} = 4.3\text{ mA}$ (典型值)
- 灵活的调光选项：
 - 对每个 LED 点进行单独的开关控制
 - 模拟调光 (电流增益控制)
 - 为所有 LED 点提供全局 3 位最大电流 (MC) 设置
 - 为红色、绿色和蓝色提供 3 组 7 位颜色电流 (CC) 设置
 - 为每个 LED 点提供单独的 8 位点电流 (DC) 设置
 - 以无可闻噪声的频率进行 PWM 调光
 - 为所有 LED 点实现全局 8 位 PWM 调光
 - 为 LED 点任意映射实现 3 组可编程 8 位 PWM 调光
 - 为每个 LED 点实现单独的 8 位或 16 位 PWM 调光
- 完整的可寻址 SRAM，可更大幅度地减少数据流量
- 针对各个 LED 点进行开路/短路检测
- 提供重影消除和低亮度补偿功能
- 接口选项：
 - 当 IFS 为低电平时采用 1MHz (最大值) I²C 接口
 - 当 IFS 为高电平时采用 12MHz (最大值) SPI 接口

2 应用

- 用于以下设备的 LED 动画和指示：
 - 键盘、鼠标和游戏附件

- 大型和智能家用电器
 - 智能音箱、有线和无线音箱
 - 混音器、DJ 设备和广播
 - 接入设备、交换机和服务器
- 用于光学模块的恒定电流阱

3 说明

电子设备变得越来越智能，而且需要使用更多的 LED 提供动画效果和指示功能，因此需要使用高性能 LED 矩阵驱动器以小尺寸解决方案改善用户体验。

LP586x 器件是高性能 LED 矩阵驱动器系列。该系列器件集成了 18 个具有 N (N = 1/2/4/6/8/11) 个开关 MOSFET 的恒定电流阱，以支持 N × 18 个 LED 点或 N × 6 个 RGB LED。LP5860 集成了 11 个 MOSFET，从而支持多达 198 个 LED 点或 66 个 RGB LED。

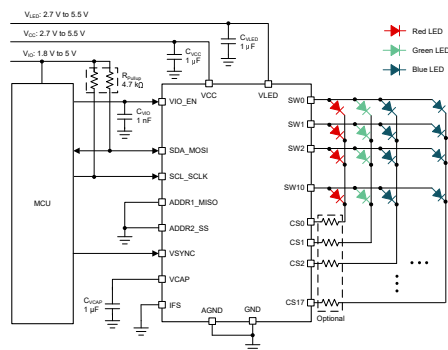

LP5860 同时支持模拟调光和 PWM 调光方法。对于模拟调光，能够以 256 个阶跃来调节每个 LED 点。对于 PWM 调光，集成式 8 位或 16 位可配置 PWM 发生器可实现平滑且无可闻噪声的调光控制。也可以将每个 LED 点任意映射到 8 位组 PWM，以实现共同调光控制。

LP5860 器件实现了完整的可寻址 SRAM，可更大幅度地减少数据流量。集成了重影消除电路以消除上下重影。LP5860 还支持 LED 开路和短路检测功能。LP5860 同时支持 1MHz (最大值) I²C 和 12MHz (最大值) SPI。

器件信息

器件型号	封装 ⁽¹⁾	封装尺寸 (标称值)
LP5860	VQFN (40)	5mm × 5mm

- (1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

6 Pin Configuration and Functions

图 6-1. LP5860 RKP Package 40-Pin VQFN with Exposed Thermal Pad Top View

表 6-1. Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	CS0	O	Current sink 0. If not used, this pin must be left floating.
2	CS1	O	Current sink 1. If not used, this pin must be left floating.
3	CS2	O	Current sink 2. If not used, this pin must be left floating.
4	CS3	O	Current sink 3. If not used, this pin must be left floating.
5	CS4	O	Current sink 4. If not used, this pin must be left floating.
6	CS5	O	Current sink 5. If not used, this pin must be left floating.
7	CS6	O	Current sink 6. If not used, this pin must be left floating.
8	CS7	O	Current sink 7. If not used, this pin must be left floating.
9	CS8	O	Current sink 8. If not used, this pin must be left floating.
10	SW0	O	High-side PMOS switch output for scan line 0. If not used, this pin must be left floating.
11	SW1	O	High-side PMOS switch output for scan line 1. If not used, this pin must be left floating.
12	SW2	O	High-side PMOS switch output for scan line 2. If not used, this pin must be left floating.
13	SW3	O	High-side PMOS switch output for scan line 3. If not used, this pin must be left floating.
14	SW4	O	High-side PMOS switch output for scan line 4. If not used, this pin must be left floating.
15	SW5	O	High-side PMOS switch output for scan line 5. If not used, this pin must be left floating.
16	VLED	Power	Power input for high-side switches.

表 6-1. Pin Functions (continued)

PIN		I/O	DESCRIPTION
NO.	NAME		
17	SW6	O	High-side PMOS switch output for scan line 6. If not used, this pin must be left floating.
18	SW7	O	High-side PMOS switch output for scan line 7. If not used, this pin must be left floating.
19	SW8	O	High-side PMOS switch output for scan line 8. If not used, this pin must be left floating.
20	SW9	O	High-side PMOS switch output for scan line 9. If not used, this pin must be left floating.
21	SW10	O	High-side PMOS switch output for scan line 10. If not used, this pin must be left floating.
22	CS9	O	Current sink 9. If not used, this pin must be left floating.
23	CS10	O	Current sink 10. If not used, this pin must be left floating.
24	CS11	O	Current sink 11. If not used, this pin must be left floating.
25	CS12	O	Current sink 12. If not used, this pin must be left floating.
26	CS13	O	Current sink 13. If not used, this pin must be left floating.
27	CS14	O	Current sink 14. If not used, this pin must be left floating.
28	CS15	O	Current sink 15. If not used, this pin must be left floating.
29	CS16	O	Current sink 16. If not used, this pin must be left floating.
30	CS17	O	Current sink 17. If not used, this pin must be left floating.
31	AGND	Ground	Analog ground. Must be connected to exposed thermal pad and common ground plane.
32	VCAP	O	Internal LDO output. An 1- μ F capacitor must be connected between this pin with GND. Place the capacitor as close to the device as possible.
33	IFS	I	Interface type select. I ² C is selected when IFS is low. SPI is selected when IFS is high. A resistor must be connected between VIO and this pin.
34	VSYNC	I	External synchronize signal for display mode 2 and mode 3.
35	SCL_SCLK	I	I ² C clock input or SPI clock input. Pull up to VIO when configured as I ² C.
36	SDA_MOSI	I/O	I ² C data input or SPI leader output follower input. Pull up to VIO when configured as I ² C.
37	ADDR0_MISO	I/O	I ² C address select 0 or SPI leader input follower output.
38	ADDR1_SS	I	I ² C address select 1 or SPI follower select.
39	VIO_EN	Power,I	Power supply for digital circuits and chip enable. An 1-nF capacitor must be connected between this pin with GND and be placed as close to the device as possible.
40	VCC	Power	Power supply for device. A 1- μ F capacitor must be connected between this pin with GND and be placed as close to the device as possible.
Exposed Thermal Pad	GND	Ground	Must be connected to AGND and common ground plane.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Voltage on V _{CC} / V _{LED} / VIO / EN / CS / SW / SDA / SCL / SCLK / MOSI / MISO / SS / ADDR0 / ADDR1 / VSYNC / IFS		- 0.3	6	V
Voltage on VCAP		- 0.3	2	V
T _J	Junction temperature	- 55	150	°C
T _{stg}	Storage temperature	- 65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins ⁽¹⁾	±3000	V
		Charged device model (CDM), per ANSI/ESDA/ JEDEC JS-002, all pins ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Input voltage on V _{CC}	Supply voltage	2.7		5.5	V
Input voltage on V _{LED}	LED supply voltage	2.7		5.5	V
Input voltage on VIO_EN		1.65		5.5	V
Voltage on SDA / SCL / SCLK / MOSI / MISO / SS / ADDR _x / VSYNC / IFS				VIO	V
T _A	Operating ambient temperature	- 40		85	°C
T _A	Operating ambient temperature - LP5860MRKPR, LP5864MRSMR, and LP5866MDBTR only	- 55		125	°C

7.4 Thermal Information

THERMAL METRIC		LP5860, LP5868, LP5866	UNIT
		RKP (VQFN)	
		40 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	31.4	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	22.9	°C/W
R _{θJB}	Junction-to-board thermal resistance	12.0	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	0.3	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	12.0	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	3.5	°C/W

7.5 Electrical Characteristics

$V_{CC} = 3.3V$, $V_{LED} = 3.8V$, $V_{IO} = 1.8V$ and $T_A = -40^{\circ}C$ to $+85^{\circ}C$ ($T_A = -55^{\circ}C$ to $+125^{\circ}C$ for LP5860MRKPR, LP5864MRKPR, and LP5866MDBTR); Typical values are at $T_A = 25^{\circ}C$ (unless otherwise specified)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Power supplies						
V_{CC}	Device supply voltage		2.7		5.5	V
V_{UVR}	Undervoltage restart	V_{CC} rising, Test mode			2.5	V
V_{UVF}	Undervoltage shutdown	V_{CC} falling, Test mode	1.9			V
V_{UV_HYS}	Undervoltage shutdown hysteresis			0.3		V
V_{CAP}	Internal LDO output	$V_{CC} = 2.7 V$ to $5.5 V$		1.78		V
I_{CC}	Shutdown supply current $I_{SHUTDOWN}$	$V_{EN} = 0 V$, $CHIP_EN = 0$ (bit), measure the total current from V_{CC} and V_{LED}		0.1	1	μA
	Standby supply current $I_{STANDBY}$	$V_{EN} = 3.3 V$, $CHIP_EN = 0$ (bit), measure the total current from V_{CC} and V_{LED}		5.5	10	μA
	Active mode supply current I_{NORMAL}	$V_{EN} = 3.3 V$, $CHIP_EN = 1$ (bit), all channels $I_{OUT} = 5 mA$ ($MC = 1$, $CC = 127$, $DC = 256$), measure the current from V_{CC}		4.3	6	mA
V_{LED}	LED supply voltage		2.7		5.5	V
V_{VIO}	VIO supply voltage		1.65		5.5	V
I_{VIO}	VIO supply current	Interface idle			5	μA
Output Stages						
I_{CS}	Constant current sink output range (CS0 - CS17)	$2.7 \leq V_{CC} < 3.3 V$, PWM = 100%	0.1		40	mA
		$V_{CC} \geq 3.3 V$ PWM = 100%	0.1		50	mA
I_{LKG}	Leakage current (CS0 - CS17)	channels off, up_degghost = 0, $V_{CS} = 5 V$		0.1	1	μA
I_{ERR_DD}	Device to device current error, $I_{ERR_DD} = (I_{AVE} - I_{SET}) / I_{SET} \times 100\%$	All channels ON. Current set to 0.1 mA. MC = 0 CC = 42 DC = 25 PWM = 100%	-7		7	%
		All channels ON. Current set to 1 mA. MC = 2 CC = 127 DC = 25 PWM = 100%	-5		5	%
		All channels ON. Current set to 10 mA. MC = 2 CC = 127 DC = 255 PWM = 100%	-3.5		3.5	%
		All channels ON. Current set to 25 mA. MC = 7 CC = 64 DC = 255 PWM = 100%	-3.5		3.5	%
		All channels ON. Current set to 50 mA. MC = 7 CC = 127 DC = 255 PWM = 100%	-3		3	%
I_{ERR_CC}	Channel to channel current error, $I_{ERR_CC} = (I_{OUTX} - I_{AVE}) / I_{AVE} \times 100\%$	All channels ON. Current set to 0.1 mA. MC = 0 CC = 42 DC = 25 PWM = 100%	-5.5		5.5	%
		All channels ON. Current set to 1 mA. MC = 2 CC = 127 DC = 25 PWM = 100%	-5		5	%
		All channels ON. Current set to 10 mA. MC = 2 CC = 127 DC = 255 PWM = 100%	-4		4	%
		All channels ON. Current set to 25 mA. MC = 7 CC = 64 DC = 255 PWM = 100%	-3.5		3.5	%
		All channels ON. Current set to 50 mA. MC = 7 CC = 127 DC = 255 PWM = 100%	-3		3	%
f_{PWM}	LED PWM frequency	PWM_Fre = 1, PWM = 100%		62.5		KHz
		PWM_Fre = 0, PWM = 100%		125		KHz

7.5 Electrical Characteristics (continued)

$V_{CC} = 3.3V$, $V_{LED} = 3.8V$, $V_{IO} = 1.8V$ and $T_A = -40^{\circ}C$ to $+85^{\circ}C$ ($T_A = -55^{\circ}C$ to $+125^{\circ}C$ for LP5860MRKPR, LP5864MRKPR, and LP5866MDBTR); Typical values are at $T_A = 25^{\circ}C$ (unless otherwise specified)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{SAT}	Output saturation voltage	$I_{OUT} = 50$ mA, decreasing output voltage, when the LED current has dropped 5%			0.45	V
		$I_{OUT} = 30$ mA, decreasing output voltage, when the LED current has dropped 5%			0.4	V
		$I_{OUT} = 10$ mA, decreasing output voltage, when the LED current has dropped 5%			0.35	V
R_{SW}	High-side PMOS ON resistance	$V_{LED} = 2.7$ V, $I_{SW} = 200$ mA		450	550	m Ω
		$V_{LED} = 2.7$ V, $I_{SW} = 200$ mA, LP5860MRKPR and LP5864MRSMR		450	570	m Ω

8 Detailed Description

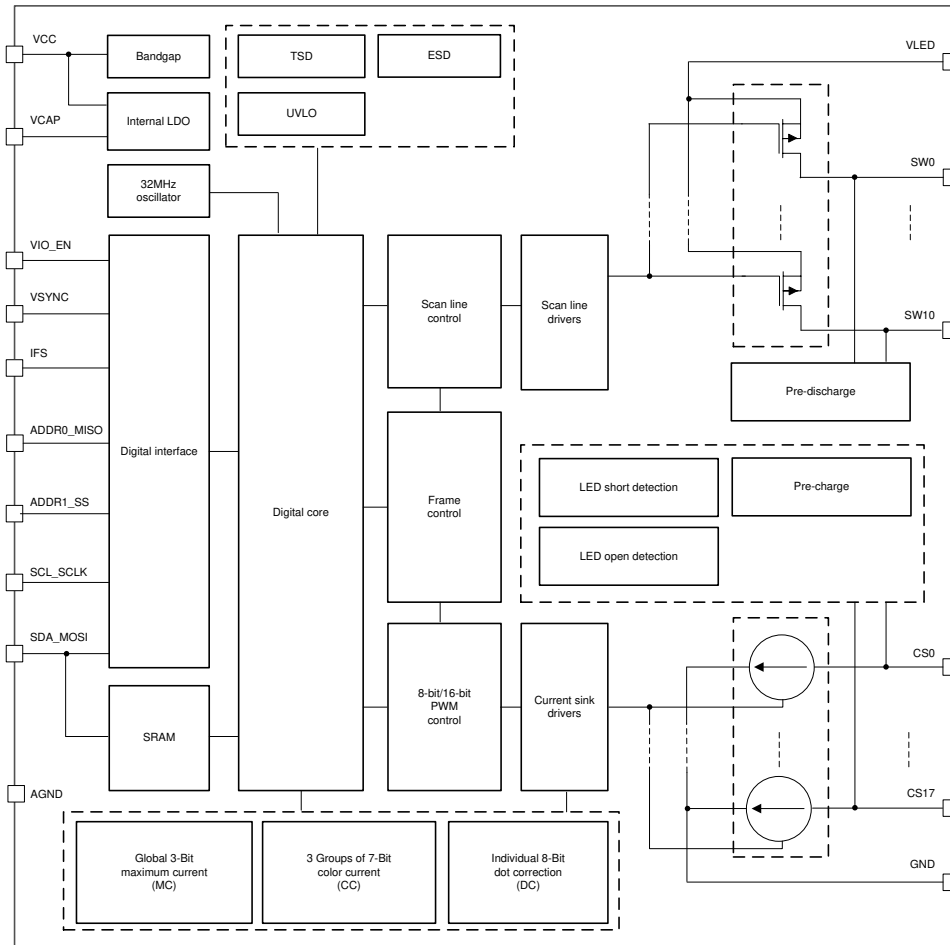

8.1 Overview

The LP5860 is an 11 × 18 LED matrix driver. The device integrates 11 switching FETs with 18 constant current sinks. One LP5860 device can drive up to 198 LED dots or 66 RGB pixels by using time-multiplexing matrix scheme.

The LP5860 supports both analog dimming and PWM dimming methods. For analog dimming, the current gain of each individual LED dot can be adjusted with 256 steps through 8-bits dot correction. For PWM dimming, the integrated 8-bits or 16-bits configurable, > 20-KHz PWM generators for each LED dot enable smooth, vivid animation effects without audible noise. Each LED can also be mapped into a 8-bits group PWM to achieve the group control with minimum data traffic.

The LP5860 device implements full addressable SRAM. The device supports entire SRAM data refresh and partial SRAM data update on demand to minimize the data traffic. The LP5860 implements the ghost cancellation circuit to eliminate both upside and downside ghosting. The LP5860 also uses low brightness compensation technology to support high density LED pixels. Both 1-MHz (maximum) I²C and 12-MHz (maximum) SPI interfaces are available in the LP5860.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Time-Multiplexing Matrix

The LP5860 device uses time-multiplexing matrix scheme to support up to 198 LED dots with one chip. The device integrates 18 current sinks with 11 scan lines to drive 18 × 11 = 198 LED dots or 6 × 11 = 66 RGB pixels.

In matrix control scheme, the device scans from Line 0 to Line 10 sequentially as shown in 图 8-1. Current gain and PWM duty registers are programmable for each LED dot to support individual analog and PWM dimming.

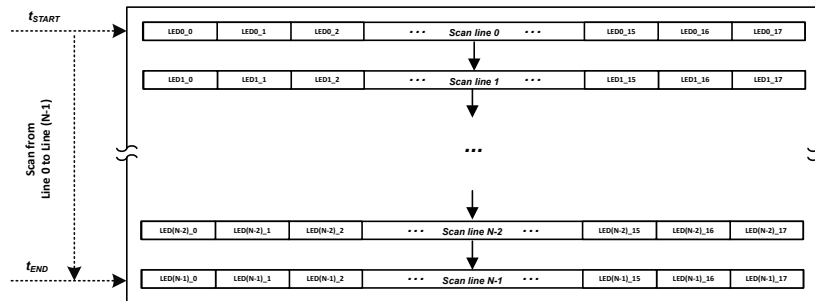

图 8-1. Scan Line Control Scheme

There are 11 high-side p-channel MOSFETs (PMOS) integrated in LP5860 device. Users can flexibly set the active scan numbers from 1 to 11 by configuring the 'Max_Line_Num' in Dev_initial register. The time-multiplexing matrix timing sequence follows the 图 8-2.

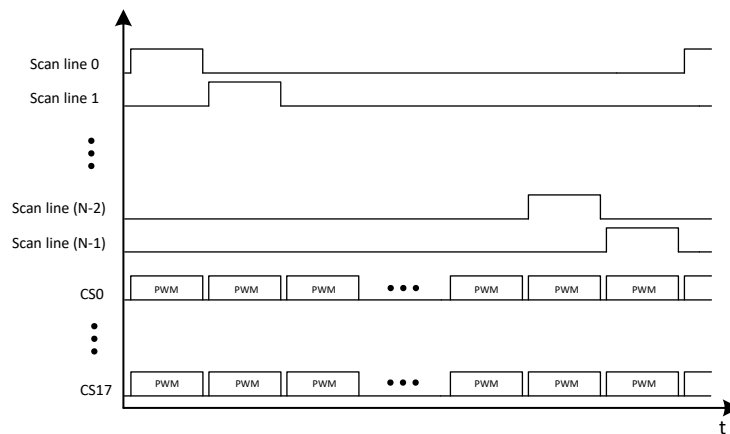

图 8-2. Time-Multiplexing Matrix Timing Sequence

One cycle time of the line switching can be calculated as below:

$$t_{\text{line_switch}} = t_{\text{PWM}} + t_{\text{SW_BLK}} + 2 \times t_{\text{phase_shift}} \quad (1)$$

- t_{PWM} is the current sink active time, which equals to 8 us (PWM frequency set at 125 kHz) or 16 us (PWM frequency set at 62.5 kHz) by configuring 'PWM_Fre' in Dev_initial register.
- $t_{\text{SW_BLK}}$ is the switch blank time, which equals to 1 us or 0.5 us by configuring 'SW_BLK' in Dev_config1 register.
- $t_{\text{phase_shift}}$ is the PWM phase shift time, which equal to 0 or 125 ns by configuring 'PWM_Phase_Shift' in Dev_config1 register.

Total display time for one complete sub-period is $t_{\text{sub_period}}$ and it can be calculated by the following equation:

$$t_{\text{sub_period}} = t_{\text{line_switch}} \times \text{Scan_line\#} \quad (2)$$

- Scan_line# is the scan line number determined by 'Max_Line_Num' in Dev_initial register.

The time-multiplexing matrix scheme time diagram is shown in 图 8-3. The $t_{\text{CS_ON_Shift}}$ is the current sink turning on shift by configuring 'CS_ON_Shift' bit in Dev_config1 register.

图 8-3. Time-Multiplexing Matrix Timing Diagram

The LP5860 device implements de-ghosting and low brightness compensation to remove the side effects of matrix topology:

- **De-ghosting:** Both upside de-ghosting and downside de-ghosting are implemented to eliminate the LED's unexpected weak turn-on.
 - Upside_de-ghosting: discharge each scan line during its off state. By configuring the 'Up_Deghost' in Dev_config3 register, the LP5860 discharges and clamps the scan line switch to a certain voltage.
 - Downside_deghosting: pre-charge each current sink voltage during its off state. The de-ghosting capability can be adjusted through the 'Down_Deghost' in Dev_config3 register.
- **Low Brightness Compensation:** three groups compensation are implemented to overcome the color-shift and non-uniformity in low brightness conditions. The compensation capability can be through 'Comp_Group1', 'Comp_Group2', and 'Comp_Group3' in Dev_config2 register.
 - Compensation_group 1: CS0, CS3, CS6, CS9, CS12, CS15.
 - Compensation_group 2: CS1, CS4, CS7, CS10, CS13, CS16.
 - Compensation_group 3: CS2, CS5, CS8, CS11, CS14, CS17.

8.3.2 Analog Dimming (Current Gain Control)

Analog dimming of LP5860 is achieved by configuring the current gain control. There are several methods to control the current gain of each LED.

- Global 3-bits Maximum Current (MC) setting without external resistor
- 3 Groups of 7-bits Color Current (CC) setting
- Individual 8-bit Dot Current (DC) setting

Global 3-Bits Maximum Current (MC) Setting

The MC is used to set the maximum current I_{OUT_MAX} for each current sink, and this current is the maximum peak current for each LED dot. The MC can be set with 3-bits (8 steps) from 3 mA to 50 mA. When the device is powered on, the MC data is set to default value, which is 15 mA.

For data refresh **Mode 1**, MC data is effective immediately after new data is updated. For **Mode 2** and **Mode 3**, to avoid unexpected MC data change during high speed data refreshing, MC data must be changed when all channels are off and new MC data is only updated when the 'Chip_EN' bit in Chip_en register is set to 0, and after the 'Chip_EN' returns to 1, the new MC data is effective. 'Down_Deghost' and 'Up_Deghost' in Dev_config3 work in the similar way with MC.

表 8-1. Maximum Current (MC) Register Setting

3-BITS MAXIMUM_CURRENT REGISTER		I _{OUT_MAX}
Binary	Decimal	mA
000	0	3
001	1	5
010	2	10
011 (Default)	3 (Default)	15 (Default)
100	4	20
101	5	30
110	6	40
111	7	50

3 Groups of 7-Bits Color Current (CC) Setting

The LP5860 device is able to adjust the output current of three color groups separately. For each color, the device has 7-bits data in 'CC_Group1', 'CC_Group2', and 'CC_Group3'. Thus, all color group currents can be adjusted in 128 steps from 0% to 100% of the maximum output current, I_{OUT_MAX}.

The 18 current sinks have fixed mapping to the three color groups:

- CC-Group 1: CS0, CS3, CS6, CS9, CS12, CS15.
- CC-Group 2: CS1, CS4, CS7, CS10, CS13, CS16.
- CC-Group 3: CS2, CS5, CS8, CS11, CS14, CS17.

表 8-2. 3 Groups of 7-bits Color Current (CC) Setting

7-BITS CC_GROUP1/CC_GROUP2/CC_GROUP3 REGISTER		RATIO OF OUTPUT CURRENT TO I _{OUT_MAX}
Binary	Decimal	%
000 0000	0	0
000 0001	1	0.79
000 0010	2	1.57
---	---	---
100 0000 (default)	64 (default)	50.4 (default)
---	---	---
111 1101	125	98.4
111 1110	126	99.2
111 1111	127	100

Individual 8-bit Dot Current (DC) Setting

The LP5860 can individually adjust the output current of each LED by using dot current function through DC setting. The device allows the brightness deviations of the LEDs to adjusted be individually. Each output DC is programmed with an 8-bit depth, so the value can be adjusted with 256 steps within the range from 0% to 100% of (I_{OUT_MAX} × CC/127).

表 8-3. Individual 8-bit Dot Current (DC) Setting

8-BIT DC REGISTER		RATIO OF OUTPUT CURRENT TO I _{OUT_MAX} × CC/127
Binary	Decimal	%
0000 0000	0	0
0000 0001	1	0.39
0000 0010	2	0.78
---	---	---

表 8-3. Individual 8-bit Dot Current (DC) Setting (continued)

8-BIT DC REGISTER		RATIO OF OUTPUT CURRENT TO $I_{OUT_MAX} \times CC/127$
Binary	Decimal	%
1000 0000 (Default)	128 (Default)	50.2 (Default)
---	---	---
1111 1101	253	99.2
1111 1110	254	99.6
1111 1111	255	100

In summary, the current gain of each current sink can be calculated as below:

$$I_{OUT} \text{ (mA)} = I_{OUT_MAX} \times (CC/127) \times (DC/255) \quad (3)$$

For time-multiplexing scan scheme, if the scan number is N, each LED dot's average current I_{AVG} is shown as below:

$$I_{AVG} \text{ (mA)} = I_{OUT}/N = I_{OUT_MAX} \times (CC/127) \times (DC/255)/N \quad (4)$$

8.3.3 PWM Dimming

There are several methods to control the PWM duty cycle of each LED dot.

- **Individual 8-bit / 16-bit PWM for Each LED Dot**

Every LED has an individual 8-bit or 16-bit PWM register that is used to change the LED brightness by PWM duty. The LP5860 uses an enhanced spectrum PWM (ES-PWM) algorithm to achieve 16-bit depth with high refresh rate and this can avoid flicker under high speed camera. Comparing with conventional 8-bit PWM, 16-bit PWM can help to achieve ultimate high dimming resolution in LED animation applications.

- **3 Programmable Groups of 8-bit PWM Dimming**

The group PWM Control is used to select LEDs into 1 to 3 groups where each group has a separate register for duty cycle control. Every LED has 2-bit selection in LED_DOT_GROUP Registers (x = 0, 1, ..., 54.) to select whether it belongs to one of the three groups or not:

- 00: not a member of any group
- 01: member of group 1
- 10: member of group 2
- 11: member of group 3

- **8-bit PWM for Global Dimming**

The Global PWM Control function affects all LEDs simultaneously.

The final PWM duty cycle can be calculated as below:

$$PWM_Final(8\text{-bit}) = PWM_Individual(8\text{-bit}) \times PWM_Group(8\text{-bit}) \times PWM_Global(8\text{-bit}) \quad (5)$$

$$PWM_Final(16\text{-bit}) = PWM_Individual(16\text{-bit}) \times PWM_Group(8\text{-bit}) \times PWM_Global(8\text{-bit}) \quad (6)$$

The LP5860 supports 125-kHz or 62.5-kHz PWM output frequency. The PWM frequency is selected by configuring the 'PWM_Fre' in Dev_initial register. An internal 31.2-MHz oscillator is used for generating PWM outputs. The oscillator's high accuracy design ($f_{OSC_ERR} \leq \pm 3\%$) enables a better synchronization if multiple LP5860 devices are connected together.

A PWM phase-shifting scheme is implemented in each current sink to avoid the current overshoot when turning on simultaneously. As the LED drivers are not activated simultaneously, the peak load current from the pre-stage power supply is significantly decreased. This scheme also reduces input-current ripple and ceramic-capacitor

audible ringing. LED drivers are grouped into three different phases. By configuring the 'PWM_Phase_Shift' in Dev_config1 register, which is default off, the LP5860 supports $t_{\text{phase_shift}} = 125\text{-ns}$ shifting time shown in 图 8-4.

- Phase 1: CS0, CS3, CS6, CS9, CS12, CS15.
- Phase 2: CS1, CS4, CS7, CS10, CS13, CS16.
- Phase 3: CS2, CS5, CS8, CS11, CS14, CS17.

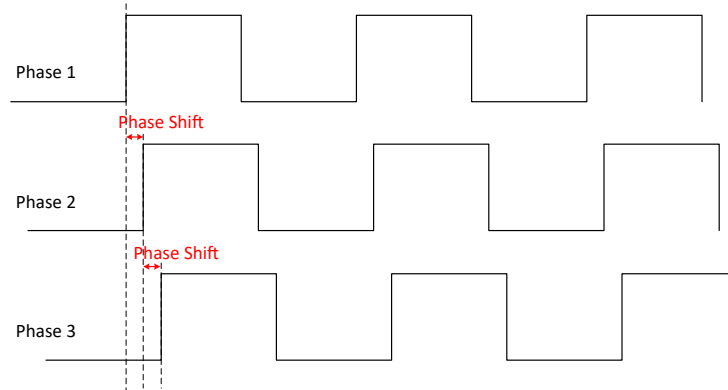

图 8-4. Phase Shift

To avoid high current sinks output ripple during line switching, current sinks can be configured to turn on with 1 clock delay (62.5ns or 31.25ns according to the PWM frequency) after lines turn on, as shown in 图 8-3. This function can be configured by 'CS_ON_Shift' in Dev_config1 register.

The LP5860 allows users to configure the dimming scale either exponentially (Gamma Correction) or linearly through the 'PWM_Scale_Mode' in Dev_config1 register. If a human-eye-friendly dimming curve is desired, using the internal fixed exponential scale is an easy approach. If a special dimming curve is desired, using the linear scale with software correction is recommended. The LP5860 supports both linear and exponential dimming curves under 8-bit and 16-bit PWM depth. 图 8-5 is an example of 8-bit PWM depth.

图 8-5. Linear and Exponential Dimming Curves

In summary, the PWM control method is illustrated as 图 8-6:

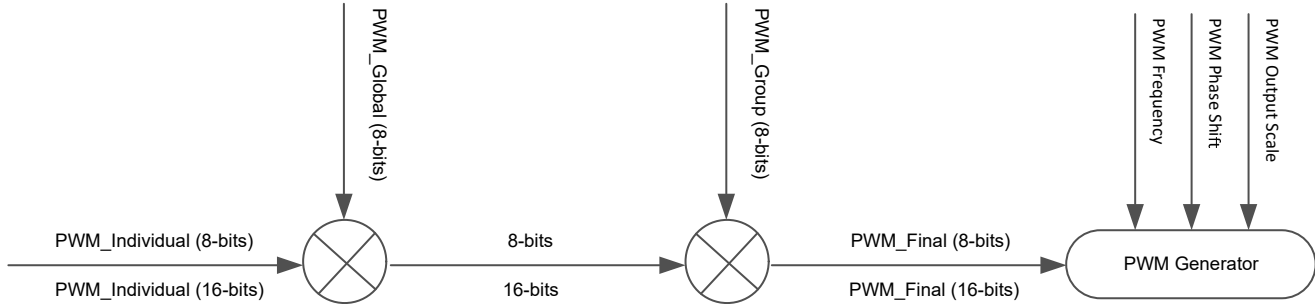

图 8-6. PWM Control Scheme

8.3.4 ON and OFF Control

The LP5860 device supports the individual ON and OFF control of each LED. For indication purpose, users can turn on and off the LED directly by writing 1-bit ON and OFF data to the corresponding Dot_onoffx (x = 0, 1, ..., 32) register.

8.3.5 Data Refresh Mode

The LP5860 supports three data refresh modes: Mode 1, Mode 2, and Mode 3, by configuring 'Data_Ref_Mode' in Dev_initial register.

Mode 1: 8-bit PWM data without VSYNC command. Data is sent out for display instantly after received. With Mode1, users can refresh the corresponding dots' data only instead of updating the whole SRAM. It is called 'on demand data refresh', which can save the total data volume effectively. As shown in 图 8-7, the red LED dots can be refreshed after sending the corresponding data while the others kept the same with last frame.

图 8-7. On Demand Data Refresh - Mode 1

Mode 2: 8-bit PWM data with VSYNC command. Data is held and sent out simultaneously by frame after receiving the VSYNC command.

Mode 3: 16-bit PWM data with VSYNC command. Data is held and sent out simultaneously by frame after receiving the VSYNC command.

Frame control is implemented in Mode 2 and Mode 3. Instead of refreshing the output instantly after data is received (Mode 1), the device holds the data and refreshes the whole frame data by a fixed frame rate, f_{VSYNC} . Usually, 24 Hz, 50 Hz, 60 Hz, 120Hz or even higher frame rate is selected to achieve vivid animation effects. Whole SRAM Data Refresh is shown in 图 8-8, a new frame is updated after receiving the VSYNC command.

图 8-8. Whole SRAM Data Refresh

Comparing with Mode 1, Mode 2 and Mode 3 provide a better synchronization when multiple LP5860 devices used together. A high-level pulse width longer than $t_{\text{SYNC_H}}$ is required at the beginning of each VSYNC frame. 图 8-9 shows the VSYNC connections and 图 8-10 shows the timing requirements.

图 8-9. Multiple Devices Sync

图 8-10. VSYNC Timing

Table 8-4 is the summary of the 3 data refresh modes.

表 8-4. Data Refresh Mode

MODE TYPE	PWM RESOLUTION	PWM OUTPUT	EXTERNAL VSYNC
Mode 1	8 Bits	Data update instantly	No
Mode 2	8 Bits	Data update by frame	Yes
Mode 3	16 Bits		

8.3.6 Full Addressable SRAM

SRAM is implemented inside the LP5860 device to support data writing and reading at the same time.

Although data refresh mechanisms are not the same for Mode 1 and Mode 2/3, the data writing and reading follow the same method. Users can update partial of the SRAM data only or the whole SRAM page simultaneously. The LP5860 supports auto-increment function to minimize data traffic and increase data transfer efficiency.

Please be noted that 16-bit PWM (Mode 3) and 8-bit PWM (Mode 1 and Mode 2) are assigned with different SRAM addresses.

8.3.7 Protections and Diagnostics

LED Open Detection

The LP5860 includes LED open detection (LOD) for the fault caused by any opened LED dot. The threshold for LED open is 0.25-V typical. LED open detection is only performed when $\text{PWM} \geq 25$ (Mode 1 and Mode 2) or $\text{PWM} \geq 6400$ (Mode 3) and voltage on CSn is detected lower than open threshold for continuously 4 sub-periods.

图 8-11 shows the detection circuit of LOD function. When open fault is detected, 'Global_LOD' bit in Fault_state register is set to 1 and detailed fault state for each LED would also be monitored in register Dot_lodx (x = 0, 1, ..., 32). All open fault indicator bits can be cleared by setting LOD_clear = 0Fh after the open condition is removed.

LOD removal function can be enabled by setting 'LOD_removal' bit in Dev_config2 register to 1. This function turns off the current sink of the open channel when scanning to the line where the opened LED is included.

图 8-11. LOD Circuits

LED Short Detection

The LP5860 includes LED short detection (LSD) for the fault caused by any shorted LED. Threshold for channel short is $(V_{LED} - 1) V$ typical. LED short detection only performed when $PWM \geq 25$ (Mode 1 and Mode 2) or $PWM \geq 6400$ (Mode 3) and voltage on CSn is detected higher than short threshold for continuously 4 sub-periods. As there is parasitic capacitance for the current sink, to make sure the LSD result is correct, it is recommended to set the LED current higher than 0.5 mA.

图 8-12 shows the detection circuit of LSD function. When short fault is detected, 'Global_LSD bit' in Fault_state register is set to 1 and detailed fault state for every channel are also monitored in register Dot_Isdx ($x = 0, 1, \dots, 32$). All short fault indicator bits can be cleared by setting $LSD_clear = 0Fh$ after the short condition is removed.

LSD removal function can be enabled by setting 'LSD_removal' bit in Dev_config2 register to 1. This function turns off the upside deghosting function of the scan line where short LED is included.

图 8-12. LSD Circuit

Thermal Shutdown

The LP5860 device implements thermal shutdown mechanism to protect the device from damage due to overheating. When the junction temperature rises to 160°C (typical) and above, the device switches into shutdown mode. The LP5860 exits thermal shutdown when the junction temperature of the device drops to 145°C (typical) and below.

UVLO (Under Voltage Lock Out)

The LP5860 has an internal comparator that monitors the voltage at VCC. When VCC is below V_{UVF} , reset is active and the LP5860 enters INITIALIZATION state.

8.4 Device Functional Modes

图 8-13. Device Functional Modes

- **SHUTDOWN:** The device enters into SHUTDOWN mode from all states on VCC power up or EN pin is low.
- **HARDWARE POR:** The device enters into HARDWARE POR when Enable pin is high or VCC fall under V_{UVF} causing UVLO=H from all states.
- **SOFTWARE RESET:** The device enters into SOFTWARE RESET mode when VCC rise higher than V_{UVR} with the time $t > t_{POR_H}$. In this mode, all the registers are reset. Entry can also be from any state when the RESET (register) = FFh or UVLO is low.
- **STANDBY:** The device enters the STANDBY mode when Chip_EN (register) = 0. In this mode, device enters into low power mode, but the I²C/SPI are still available for Chip_EN only and the registers' data are retained.
- **NORMAL:** The device enters the NORMAL mode when 'Chip_EN' = 1 with the time $t > t_{CHIP_EN}$.
- **THERMAL SHUTDOWN:** The device automatically enters the THERMAL SHUTDOWN mode when the junction temperature exceeds 160°C (typical). If the junction temperature decreases below 145°C (typical), the device returns to the NORMAL mode.

8.5 Programming

Interface Selection

The LP5860 supports two communication interfaces: I²C and SPI. If IFS is high, the device enters into SPI mode. If IFS is low, the device enters into I²C mode.

表 8-5. Interface Selection

INTERFACE TYPE	ENTRY CONDITION
I ² C	IFS = Low
SPI	IFS = High

I²C Interface

The LP5860 is compatible with I²C standard specification. The device supports both fast mode (400-KHz maximum) and fast plus mode (1-MHz maximum).

I²C Data Transactions

The data on SDA line must be stable during the HIGH period of the clock signal (SCL). In other words, state of the data line can only be changed when clock signal is LOW. START and STOP conditions classify the beginning and the end of the data transfer session. A START condition is defined as the SDA signal transitioning from HIGH to LOW while SCL line is HIGH. A STOP condition is defined as the SDA transitioning from LOW to HIGH while SCL is HIGH. The bus leader always generates START and STOP conditions. The bus is considered to be busy after a START condition and free after a STOP condition. During data transmission, the bus leader can generate repeated START conditions. First START and repeated START conditions are functionally equivalent.

Each byte of data has to be followed by an acknowledge bit. The acknowledge related clock pulse is generated by the leader. The leader releases the SDA line (HIGH) during the acknowledge clock pulse. The device pulls down the SDA line during the 9th clock pulse, signifying an acknowledge. The device generates an acknowledge after each byte has been received.

There is one exception to the acknowledge after every byte rule. When the leader is the receiver, it must indicate to the transmitter an end of data by not acknowledging (*negative acknowledge*) the last byte clocked out of the follower. This negative acknowledge still includes the acknowledge clock pulse (generated by the leader), but the SDA line is not pulled down.

I²C Data Format

The address and data bits are transmitted MSB first with 8-bits length format in each cycle. Each transmission is started with Address Byte 1, which are divided into 5-bits of the chip address, 2 higher bits of the register address, and 1 read/write bit. The other 8 lower bits of register address are put in Address Byte 2. The device supports both independent mode and broadcast mode. The auto-increment feature allows writing / reading several consecutive registers within one transmission. If not consecutive, a new transmission must be started.

表 8-6. I²C Data Format

Address Byte1	Chip Address					Register Address		R/W
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Independent	1	0	0	ADDR1	ADDR0	9 th bit	8 th bit	R: 1 W: 0
Broadcast	1	0	1	0	1			
Address Byte2	Register Address							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
	7 th bit	6 th bit	5 th bit	4 th bit	3 th bit	2 th bit	1 th bit	0 th bit

图 8-14. I²C Write Timing

图 8-15. I²C Read Timing

Multiple Devices Connection

The LP5860 enters into I²C mode if IFS is connected to GND. The ADDR0/1 pin is used to select the unique I²C follower address for each device. The SCL and SDA lines must each have a pullup resistor (4.7 KΩ for 400 KHz, 2 KΩ for 1 MHz) placed somewhere on the line and remain HIGH even when the bus is idle. VIO_EN can either be connected with VIO power supply or GPIO. It’s suggested to put one 1nF cap as closer to VIO_EN pin as possible. Up to four LP5860 follower devices can share the same I²C bus by the different ADDR configurations.

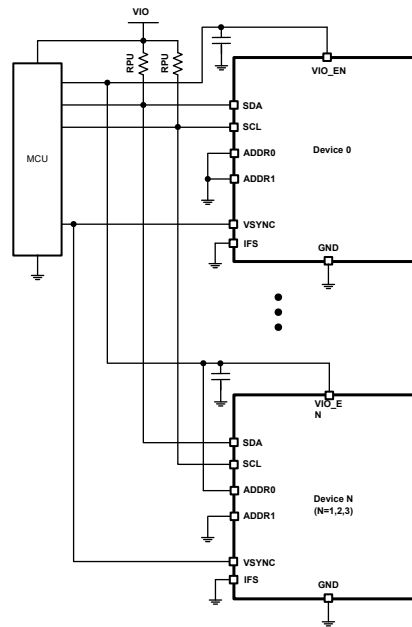

图 8-16. I²C Multiple Devices Connection

SPI Interface

The LP5860 is compatible with SPI serial-bus specification, and it operates as a follower. The maximum frequency supported by LP5860 is 12 MHz.

SPI Data Transactions

MISO output is normally in a high impedance state. When the follower-select pin SS for the device is active (low) the MISO output is pulled low for read only. During write cycle MISO stays in high-impedance state. The follower-select signal SS must be low during the cycle transmission. SS resets the interface when high. Data is clocked in on the rising edge of the SCLK clock signal, while data is clocked out on the falling edge of SCLK.

SPI Data Format

The address and data bits are transmitted MSB first with 8-bits length format in each cycle. Each transmission is started with Address Byte 1, which contains 8 higher bits of the register address. The Address Byte 2 is started with 2 lower bits of the register address and 1 read/write bit. The auto-increment feature allows writing / reading several consecutive registers within one transmission. If not consecutive, a new transmission must be started.

表 8-7. SPI Data Format

Address Byte1	Register Address								
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	
	9 th bit	8 th bit	7 th bit	6 th bit	5 th bit	4 th bit	3 th bit	2 th bit	
Address Byte2	Register Address								
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	
	1 th bit	0 th bit	R: 0 W: 1	Don't Care					

图 8-17. SPI Write Timing

图 8-18. SPI Read Timing

Multiple Devices Connection

The device enters into SPI mode if IFS is pulled high to VIO through a pullup resistor(4.7KΩ recommended). VIO_EN can either be connected with VIO power supply or GPIO. It’s suggested to put one 1nF cap as closer to VIO_EN pin as possible. In SPI mode host can address as many devices as there are follower select pins on host.

图 8-19. SPI Multiple Devices Connection

8.6 Register Maps

This section provides a summary of the register maps. For detailed register functions and descriptions, please refer to [LP5860 11x18 LED Matrix Driver Register Maps](#).

9 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The LP5860 integrates 18 constant current sinks with 11 switching FETs and one LP5860 can drive up to 198 LED dots or 66 RGB pixels and achieve great dimming effect. In smart home, gaming keyboards, and other human-machine interaction applications, the device can greatly improve user experience with small amount of components.

9.2 Typical Application

9.2.1 Application

图 9-1 shows an example of typical application, which uses one LP5860 to drive 66 common-anode RGB LEDs through I²C communication.

图 9-1. Typical Application - LP5860 Driving 66 RGB LEDs (198 LED Dots)

9.2.2 Design Requirements

表 9-1. Design Parameters

PARAMETER	VALUE
VCC / VIO	3.3 V
VLED	5 V
RGB LED count	66
Scan number	11
Interface	I ² C
LED maximum average current (red, green, blue)	4 mA, 3 mA, 2 mA
LED maximum peak current (red, green, blue)	44 mA, 33 mA, 22 mA

9.2.3 Detailed Design Procedure

LP5860 requires an external capacitor $C_{V_{CAP}}$, whose value is 1 μ F connected from V_{CAP} to GND for proper operation of internal LDO. The device must be placed as close to the device as possible.

TI recommends that 1- μ F capacitors be placed between VCC / VLED with GND, and a 1-nF capacitor placed between VIO with GND. Place the capacitors as close to the device as possible.

Pull-up resistors $R_{pull-up}$ are requirement for SCL and SDA when using I²C as communication method. In typical applications, TI recommends 1.8-k Ω to 4.7-k Ω resistors.

To decrease thermal dissipation from device to ambient, resistors R_{CS} can optionally be placed in serial with the LED. Voltage drop on these resistors must left enough margins for VSAT to ensure the device works normally.

9.2.4 Program Procedure

When selecting data refresh Mode 1, outputs are refreshed instantly after data is received.

When selecting data refresh Mode 2/3, VSYNC signal is required for synchronized display. Programming flow is showed as 图 9-2. To display full pixel of last frame, VSYNC pulse must be sent to the device after the end of last PWM. Time between two pulses t_{VSYNC} must be larger than the whole PWM time of all Dots t_{frame} . Common selection like 60 Hz, 90 Hz, 120 Hz or even higher refresh frequency can be supported. High pulse width longer than t_{VSYNC_H} is required at the beginning of each VSYNC frame, and data must not be write to PWM registers during high pulse width.

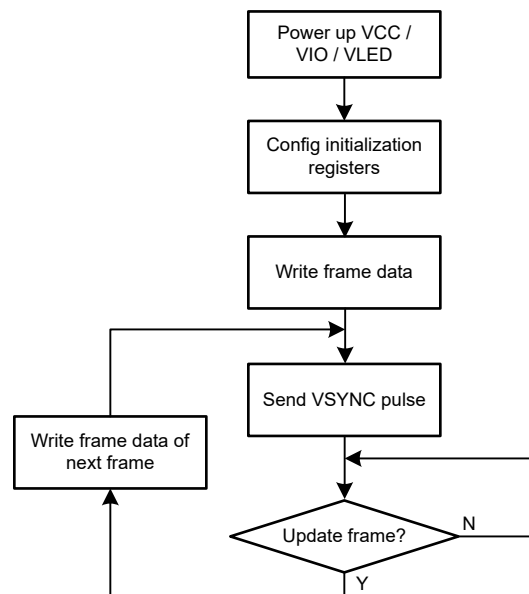

图 9-2. Program Procedure

9.2.5 Application Performance Plots

The following figures show the application performance plots.

图 9-3. Scan Lines and Current Sinks Waveforms of SW0, SW1, CS0, CS1

PWM frequency = 62.5 kHz

图 9-4. Scan Lines and Current Sinks Waveforms of SW0, SW1, CS0, CS1

PWM frequency = 125 kHz

PWM_Phase_Shift = 0h

图 9-8. PWM Phase Shift Disabled

PWM_Phase_Shift = 1h

图 9-9. PWM Phase Shift Enabled

10 Power Supply Recommendations

VDD Input Supply Recommendations

LP5860 is designed to operate from a 2.7-V to 5.5-V VDD voltage supply. This input supply must be well regulated and be able to provide the peak current required by the LED matrix. The resistance of the VDD supply rail must be low enough such that the input current transient does not cause the LP5860 VDD supply voltage to drop below the maximum POR voltage.

VLED Input Supply Recommendations

LP5860 is designed to operate with a 2.7-V to 5.5-V VLED voltage supply. The VLED supply must be well regulated and able to provide the peak current required by the LED configuration without voltage drop, under load transients like start-up or rapid brightness change. The resistance of the input supply rail must be low enough so that the input current transient does not cause the VLED supply voltage to drop below LED $V_f + V_{SAT}$ voltage.

VIO Input Supply Recommendations

LP5860 is designed to operate with a 1.65-V to 5.5-V VIO_EN voltage supply. The VIO_EN supply must be well regulated and able to provide the peak current required by the LED configuration without voltage drop under load transients like startup or rapid brightness change.

11 Layout

11.1 Layout Guidelines

Below guidelines for layout design can help to get a better on-board performance.

- The decoupling capacitors C_{VCC} and C_{VLED} for power supply must be close to the chip to have minimized the impact of high-frequency noise and ripple from power. C_{VCAP} for internal LDO must be put as close to chip as possible. GND plane connections to C_{VLED} and GND pins must be on TOP layer copper with multiple vias connecting to system ground plane. C_{VIO} for internal enable block also must be put as close to chip as possible.
- The exposed thermal pad must be well soldered to the board, which can have better mechanical reliability. This action can optimize heat transfer so that increasing thermal performance. The AGND pin must be connected to thermal pad and system ground.
- The major heat flow path from the package to the ambient is through copper on the PCB. Several methods can help thermal performance. Below exposed thermal pad of IC, putting much vias through the PCB to other ground layer can dissipate more heat. Maximizing the copper coverage on the PCB can increase the thermal conductivity of the board.
- Low inductive and resistive path of switch load loop can help to provide a high slew rate. Therefore, path of VLED - SWx must be short and wide and avoid parallel wiring and narrow trace. Transient current in SWx pins is much larger than CSy pins, so that trace for SWx must be wider than CSy.

11.2 Layout Example

图 11-1. LP5860 Layout Example

12 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

12.1 接收文档更新通知

要接收文档更新通知，请导航至 ti.com 上的器件产品文件夹。点击 [订阅更新](#) 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

12.2 支持资源

[TI E2E™ 支持论坛](#) 是工程师的重要参考资料，可直接从专家获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题可获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的 [《使用条款》](#)。

12.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

所有商标均为其各自所有者的财产。

12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.5 术语表

[TI 术语表](#) 本术语表列出并解释了术语、首字母缩略词和定义。

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LP5860MRKPR	ACTIVE	VQFN	RKP	40	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-55 to 125	LP5860M	Samples
LP5860RKPR	ACTIVE	VQFN	RKP	40	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	LP5860	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
