适用于汽车应用高频 CPU 内核电源的 TPS59603-Q1 同步降压 FET 驱动器

1 特性

- 符合面向汽车应用的 AEC-Q100 标准
  - 器件温度等级 1：-40°C 至 125°C
  - 器件人体放电模式静电放电 (ESD) 分类等级 H2
  - 器件的组件充电模式 ESD 分类等级 C3B
- 针对已优化连续传导模式 (CCM) 的精简死区时间驱动电路
- 针对已优化断续传导模式 (DCM) 效率的自动零交叉检测
- 针对已优化轻负载效率的多个低功耗模式
- 为了实现高效运行的经优化信号路径延迟
- 集成 BST 开关驱动强度针对低 RdsON FET 进行了优化
- 针对 5V FET 驱动器进行了优化
- 转换输入电压范围 (V_{IN})：2.5V 至 28V
- 具有可湿性侧面和散热焊盘的 2mm × 2mm、8 引脚、WSON 封装

2 应用

- 使用高频 CPU 的汽车后座娱乐 (RSE) 平板电脑
- 汽车 ADAS 处理器内核电源

3 说明

TPS59603-Q1 驱动器针对高频 CPU V_{CORE} 应用进行了优化，具有 降低 死区时间驱动和自动零交越等高级特性，可用于在整个负载范围内优化效率。

$\overline{SKIP}$ 引脚提供 CCM 操作选项，以支持输出电压的受控管理。此外，TPS59603-Q1 支持两种低功耗模式。借助于脉宽调制 (PWM) 输入三态，静态电流被减少至 130µA，并支持立即响应。当 $\overline{SKIP}$ 被保持在三态时，电流被减少至 8µA（恢复切换通常需要 20µs）。此驱动器与合适的德州仪器 (TI) 控制器配对使用，能够成为出色的高性能电源系统。

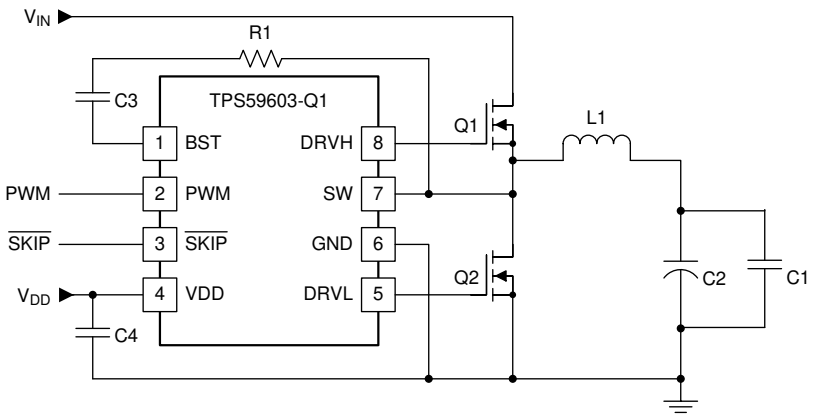

TPS59603-Q1 器件采用节省空间的耐热增强型 8 引脚、2mm x 2mm 可湿性侧面 WSON 封装，工作温度范围为 -40°C 至 125°C。

器件信息(1)

5 Pin Configuration and Functions

DSG Package
8-Pin WSON
Top View

Pin Functions

PIN		I/O(1)	DESCRIPTION
NAME	NO.		
BST	1	I	High-side N-channel FET bootstrap voltage input; power supply for high-side driver
DRVH	8	O	High-side N-channel gate drive output
DRVL	5	O	Synchronous low-side N-channel gate drive output
GND	6	G	Synchronous low-side N-channel gate drive return and device reference
PWM	2	I	PWM input. A tri-state voltage on this pin turns off both the high-side (DRVH) and low-side drivers (DRVL)
$\overline{\text{SKIP}}$	3	I	When $\overline{\text{SKIP}}$ is LO, the zero crossing comparator is active. The power chain enters discontinuous conduction mode when the inductor current reaches zero. When $\overline{\text{SKIP}}$ is HI, the zero crossing comparator is disabled, and the driver outputs follow the PWM input. A tri-state voltage on $\overline{\text{SKIP}}$ puts the driver into a very-low power state.
SW	7	I/O	High-side N-channel gate drive return. Also, zero-crossing sense input
VDD	4	I	5-V power supply input; decouple to GND with a ceramic capacitor with a value of 1 µF or greater
Thermal Pad		G	Tie to system GND plane with multiple vias

(1) I = Input, O = Output, G = Ground

6 Specifications

6.1 Absolute Maximum Ratings(1) (2)

over operating free-air temperature (unless otherwise noted)

		MIN	MAX	UNIT
Input voltage	VDD	–0.3	6	V
	PWM, $\overline{SKIP}$	–0.3	6	
Output voltage	BST	–0.3	35	V
	BST (transient <20 ns)	–0.3	38	
	BST to SW; DRVH to SW	–0.3	6	
	SW	–2	30	
	DRVH, SW (transient <20 ns)	–5	38	
	DRVL	–0.3	6	
Ground pins	GND to PAD	–0.3	0.3	V
Operating junction temperature, T_J		–40	125	°C
Storage temperature range, T_{stg}		–55	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to the network ground terminal unless otherwise noted.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per AEC Q100-002(1)	±2000	V
		Charged device model (CDM), per AEC Q100-011	±750	

(1) AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Input voltage	VDD	4.5	5	5.5	V
	PWM, $\overline{SKIP}$	–0.1		5.5	
Output voltage	BST	–0.1		34	V
	BST to SW; DRVH to SW	–0.1		5.5	
	SW	–1		28	
	DRVL	–0.1		5.5	
Ground pins	GND to PAD	–0.1		0.1	V
Operating junction temperature, T_J		–40		125	°C

6.4 Thermal Information

THERMAL METRIC(1)		TPS59603-Q1 WSON (DSG) 8 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	63.1	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	74.1	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	34.3	°C/W
ψ_{JT}	Junction-to-top characterization parameter	2.0	°C/W
ψ_{JB}	Junction-to-board characterization parameter	34.9	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	11.7	°C/W

7 Detailed Description

7.1 Overview

The TPS59603-Q1 device is a synchronous-buck MOSFET driver designed to drive both high-side and low-side MOSFETs. It allows high-frequency operation with current driving capability matched to the application. The integrated boost switch is internal. The TPS59603-Q1 device employs dead-time reduction control and shoot-through protection, which helps avoid simultaneous conduction of high-side and low-side MOSFETs. Also, the drivers improve light-load efficiency with integrated DCM-mode operation using adaptive crossing detection. Typical applications yield a steady-state duty cycle of 60% or less. For high steady-state duty cycle applications, including a small external Schottky diode may help to ensure sufficient charging of the bootstrap capacitor.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 UVLO Protection

The UVLO comparator evaluates the VDD voltage level. As V_{VDD} rises, both DRVH and DRVL hold actively low at all times until V_{VDD} reaches the higher UVLO threshold (V_{UVLO_H}). Then, the driver becomes operational and responds to PWM and $\overline{SKIP}$ commands. If VDD falls below the lower UVLO threshold (V_{UVLO_L} = V_{UVLO_H} – Hysteresis), the device disables the driver and drives the outputs of DRVH and DRVL actively low. 图 13 shows this function.

CAUTION

Do not start the driver in the very low power mode ($\overline{SKIP}$ = Tri-state).

Feature Description (接下页)

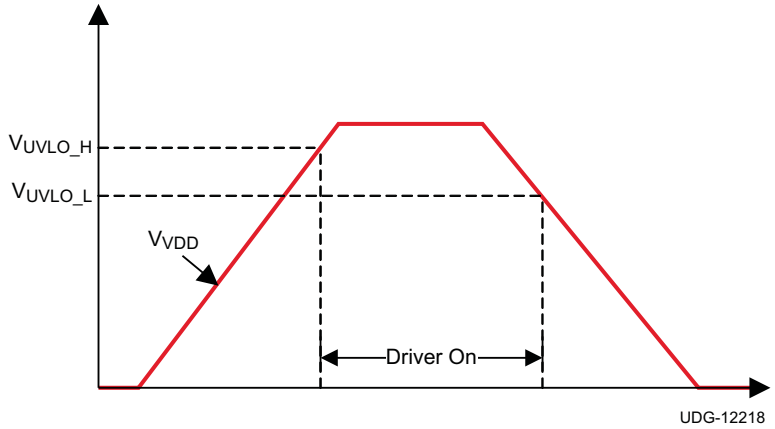

图 13. UVLO Operation

7.3.2 PWM Pin

The PWM pin incorporates an input tri-state function. The device forces the gate driver outputs to low when PWM is driven into the tri-state window and the driver enters a low power state with zero exit latency. The pin incorporates a weak pullup to maintain the voltage within the tri-state window during low-power modes. Operation into and out of a tri-state condition follows the timing diagram outlined in 图 14.

When VDD reaches the UVLO_H level, a tri-state voltage range (window) is set for the PWM input voltage. The window is defined as the PWM voltage range between PWM logic high (V_{IH}) and logic low (V_{IL}) thresholds. The device sets high-level input voltage and low-level input voltage threshold levels to accommodate both 3.3-V (typical) and 5-V (typical) PWM drive signals.

When the PWM exits the tri-state condition, the driver enters CCM for a period of 4 µs, regardless of the state of the $\overline{SKIP}$ pin. Typical operation requires this time period in order for the auto-zero comparator to resume.

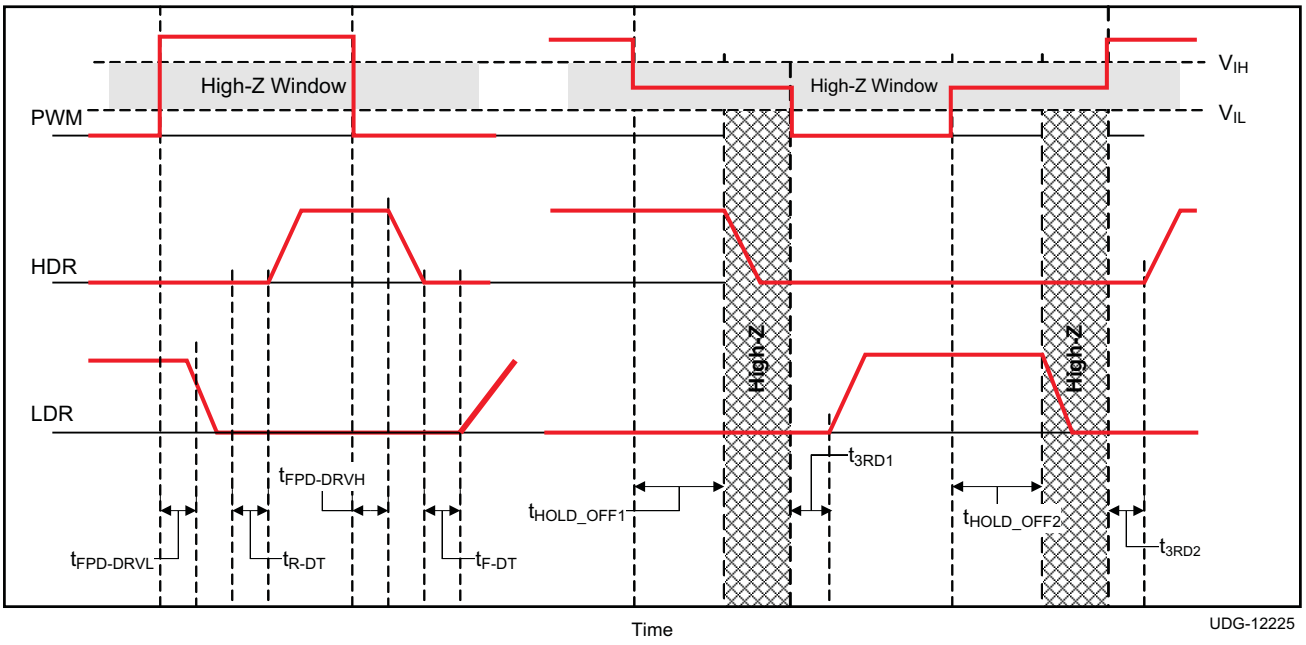

图 14. PWM Tri-State Timing Diagram

版权 © 2020, Texas Instruments Incorporated

Feature Description (接下页)

7.3.3 $\overline{\text{SKIP}}$ Pin

The $\overline{\text{SKIP}}$ pin incorporates the input tri-state buffer as PWM. The function is somewhat different. When $\overline{\text{SKIP}}$ is low, the zero crossing (ZX) detection comparator is enabled, and DCM mode operation occurs if the load current is less than the critical current. When $\overline{\text{SKIP}}$ is high, the ZX comparator disables, and the converter enters FCCM mode. When the $\overline{\text{SKIP}}$ pin is in a tri-state condition, typical operation forces the gate driver outputs low and the driver enters a very-low-power state. In the low-power state, the UVLO comparator remains off to reduce quiescent current. When the $\overline{\text{SKIP}}$ pin voltage is pulled either low or high, the driver wakes up and is able to accept PWM pulses in less than 50 µs.

表 1 shows the logic functions of UVLO, PWM, $\overline{\text{SKIP}}$, DRVH, and DRVL.

表 1. Logic Functions

UVLO	PWM	$\overline{\text{SKIP}}$	DRVL	DRVH	MODE
Active	—	—	Low	Low	Disabled
Inactive	Low	Low	High(1)	Low	DCM(1)
Inactive	Low	High	High	Low	FCCM
Inactive	High	H or L	Low	High	
Inactive	Tri-state	H or L	Low	Low	Low power
Inactive	—	Tri-state	Low	Low	Very-low power

(1) Until zero crossing protection occurs.

7.3.3.1 Zero Crossing (ZX) Operation

The zero crossing comparator is adaptive for improved accuracy. As the output current decreases from a heavy load condition, the inductor current also reduces and eventually arrives at a *valley*, where it touches zero current, which is the boundary between continuous conduction and discontinuous conduction modes. The SW pin detects the zero-current condition. When this zero inductor current condition occurs, the ZX comparator turns off the rectifying MOSFET.

7.3.4 Adaptive Dead-Time Control and Shoot-Through Protection

The driver utilizes an anti-shoot-through and adaptive dead-time control to minimize low-side body diode conduction time and maintain high efficiency. When the PWM input voltage becomes high, the low-side MOSFET gate voltage begins to fall after a propagation delay. At the same time, DRVL voltage is sensed, and high-side driving voltage starts to increase after DRVL voltage is lower than a proper threshold.

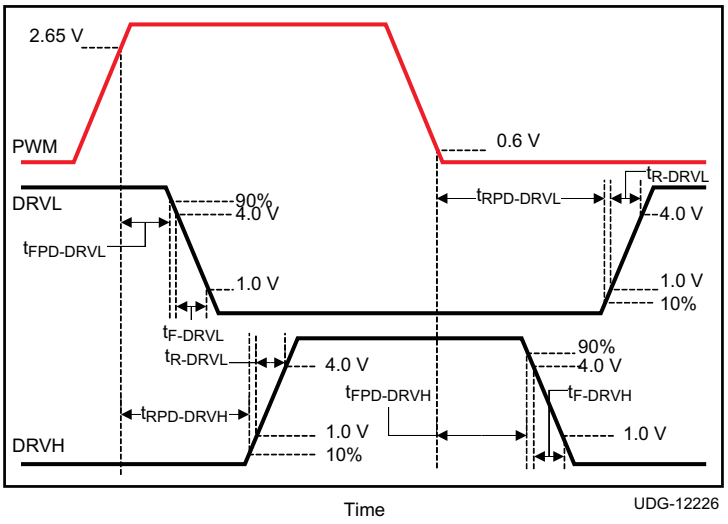

图 15. Rise and Fall Timing and Propagation Delay Definitions

Typical operation manages to near zero the dead-time between the low-side gate turn-off to high-side gate voltage turn-on, and high-side gate turn-off to low-side gate turn-on, in order to avoid simultaneous conduction of both MOSFETs, as well as to reduce body diode conduction and recovery losses. This operation also reduces ringing on the leading edge of the SW waveform.

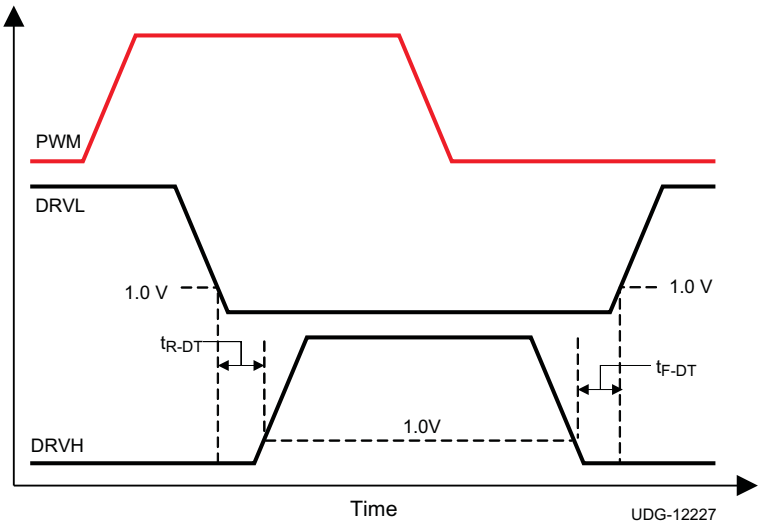

图 16. Dead-Time Definitions

7.3.5 Integrated Boost-Switch

To maintain a BST-SW voltage close to VDD (to get lower conduction losses on the high-side FET), the conventional diode between the VDD pin and BST pin is replaced by a FET, which is gated by the DRVL signal.

7.4 Device Functional Modes

The TPS59603-Q1 device operates in CCM mode when the $\overline{\text{SKIP}}$ pin is high, and it enters DCM mode when the $\overline{\text{SKIP}}$ pin is low. When both the $\overline{\text{SKIP}}$ pin and the PWM pin are in a tri-state condition, it forces the gate driver outputs low and the driver enters a very-low-power state.

版权 © 2020, Texas Instruments Incorporated

8 Power Supply Recommendations

The voltage range for the VDD pin is between 4.5 V and 5.5 V. A 5-V power supply is recommended for the VDD pin of the TPS59603-Q1 device.

9 Layout

9.1 Layout Guidelines

To improve the switching characteristics and design efficiency, these layout rules must be considered:

- Locate the driver as close as possible to the MOSFETs.
- Locate the VDD and bootstrap capacitors as close as possible to the driver.
- Pay special attention to the GND trace. Use the thermal pad of the package as the GND by connecting it to the GND pin. The GND trace or pad from the driver goes directly to the source of the MOSFET, but should not include the high current path of the main current flowing through the drain and source of the MOSFET.
- Use a similar rule for the switch-node as for the GND.
- Use wide traces for DRVH and DRVL closely following the related SW and GND traces. A width of between 80 and 100 mils is preferable where possible.
- Place the bypass capacitors as close as possible to the driver.
- Avoid PWM and enable traces going close to the SW and pad where high dV/dT voltage can induce significant noise into the relatively high-impedance leads.

A poor layout can decrease the reliability of the entire system.

9.2 Layout Recommendation

图 17 above shows the primary current loops in each phase, numbered in order of importance.

The most important loop to minimize the area of is loop 1, the path from the input capacitor through the high and low-side FETs, and back to the capacitor through ground.

Loop 2 is from the inductor through the output capacitor, ground, and Q2. The layout of the low-side gate drive (Loops 3a and 3b) is important. The guidelines for the gate drive layout are:

- Make the low-side gate drive length as short as possible (1 inch or less preferred).
- Make the DRVL width to length ratio of 1:10, wider (1:5) if possible.
- If changing layers is necessary, use at least two vias.

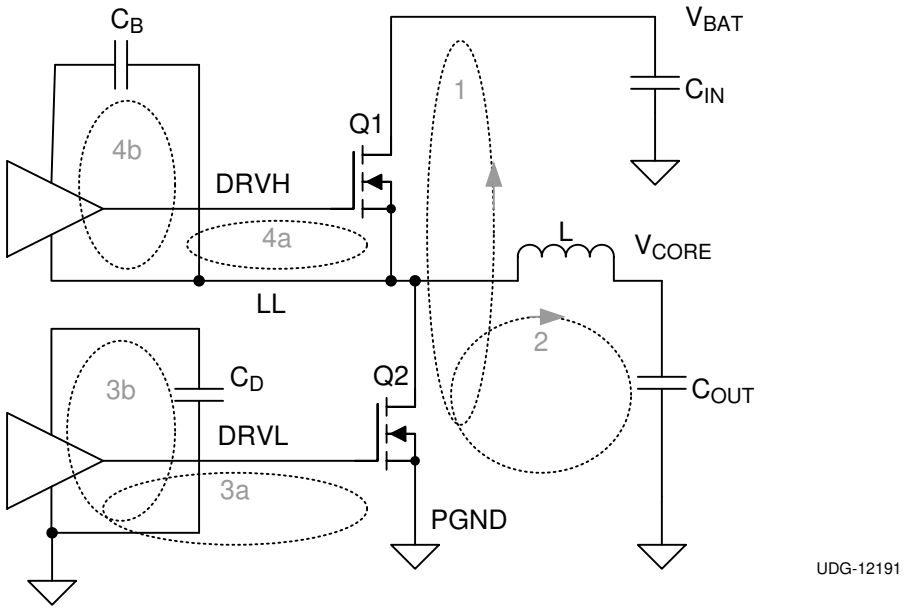

图 17. Layout recommendations to minimize major Current loops

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS59603QDSGRQ1	ACTIVE	WSON	DSG	8	3000	RoHS & Green	SN	Level-2-260C-1 YEAR	-40 to 125	603Q	Samples
TPS59603QDSGTQ1	ACTIVE	WSON	DSG	8	250	RoHS & Green	SN	Level-2-260C-1 YEAR	-40 to 125	603Q	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
