

ISO124 $\pm 10V$ 输入精密隔离放大器

1 特性

- 100% 经过高电压击穿测试
- 额定 1500Vrms
- 高 IMR: 频率 60Hz 时为 140dB
- 非线性: 0.010% (最大值)
- 双极运算: $V_O = \pm 10V$
- 封装: PDIP-16 和 SOIC-28
- 易用性: 固定单位增益配置
- 电源范围: $\pm 4.5V$ 至 $\pm 18V$

2 应用

- 工业过程控制:
 - 变送器隔离器、热电偶隔离器、RTD、压力电桥和流量计, 4mA 至 20mA 环路隔离
- 消除接地环路
- 电机和 SCR 控制
- 电源监控
- 基于 PC 的数据采集
- 测试设备

3 说明

ISO124 是一款高精度隔离放大器, 该放大器采用了全新的占空比调制-解调技术。信号以数字的形式通过 2pF 差动电容隔离层进行传输。通过数字调制, 其隔离层特点不但不会影响信号完整性, 而且为隔离层提供出色的可靠性和优秀的高频瞬变抗扰性。两种隔离层电容器都嵌入到封装的塑料主体内。

ISO124 易于使用。无需外部组件即可运行。以下是其重要规格: 最大 0.010% 的非线性值、50kHz 信号带宽和 $200\mu V/^{\circ}C$ V_{OS} 漂移。ISO124 器件提供 $\pm 4.5V$ 至 $\pm 18V$ 的电源范围, $\pm 5mA$ (采用 V_{S1} 时) 和 $\pm 5.5mA$ (采用 V_{S2} 时) 静态电流, 广泛适用于各种应用。

ISO124 采用 16 引脚 PDIP 和 28 引线 SOIC 塑料表面贴装封装。

器件信息⁽¹⁾

4 修订历史记录

Changes from Revision D (July 2016) to Revision E	Page
• 已更改 将 16 引脚 SOIC 封装更改为 16 引脚 PDIP 封装，以便与数据表最后的封装选项附录中显示的产品相匹配	1
• Changed DVA and NVF pin configuration labels to match content shown in the package option addendum at the end of the data sheet	3
• Changed parameter name from "vs temperature" to "Input offset drift" in <i>Electrical Characteristics</i> table	5
• Changed parameter name from "vs power supply" to "Power-supply rejection ratio" in <i>Electrical Characteristics</i> table	5
• Changed location of supply voltage specifications from the <i>Electrical Characteristics</i> table to the <i>Recommended Operating Conditions</i> table	5
• Changed parameter name from "Quiescent current" to "High-side analog supply current", and changed symbol from "V _{S1} " to "I _{VS1} " in <i>Electrical Characteristics</i> table	5
• Changed parameter name from "Quiescent current" to "Low-side analog supply current", and changed symbol from "V _{S2} " to "I _{VS2} " in <i>Electrical Characteristics</i> table	5
• Changed location of Temperature specifications from the <i>Electrical Characteristics</i> table to the <i>Recommended Operating Conditions</i> table	5
• Deleted Thermal resistance parameters from <i>Electrical Characteristics</i> table; see <i>Thermal Information</i> table	5

Changes from Revision C (September 2005) to Revision D	Page
• 已添加 增加了 ESD 额定值表、特性 说明 部分、器件功能模式、应用和 实施 部分、电源建议 部分、布局 部分、器件和文档支持 部分以及机械、封装和可订购信息 部分。	1

5 Pin Configuration and Functions

Pin Functions

PIN			I/O	DESCRIPTION

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

	MIN	MAX	UNIT
Supply voltage		±18	V
Analog input voltage, V_{IN}		100	V
Continuous isolation voltage		1500	V _{rms}
Junction temperature		125	°C
Output short to common		Continuous	
Storage temperature, T_{stg}	–40	125	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
V_{S1} High-side analog supply voltage ($\pm V_{S1}$ to GND1)	±4.5	±15	±18	V
V_{S2} Low-side analog supply voltage ($\pm V_{S2}$ to GND2)	±4.5	±15	±18	V
V_{IN} Analog input voltage		±10		V
T_A Operating temperature	–25		85	°C

6.4 Thermal Information

Figure 9. Signal Response to Inputs Greater than 250 kHz

7 Detailed Description

7.1 Overview

The ISO124 isolation amplifier uses an input and an output section galvanically isolated by matched 1-pF isolating capacitors built into the plastic package. The input is duty-cycle modulated and transmitted digitally across the barrier. The output section receives the modulated signal, converts it back to an analog voltage and removes the ripple component inherent in the demodulation. Input and output sections are fabricated, then laser trimmed for exceptional circuitry matching common to input and output sections. The sections are then mounted on opposite ends of the package with the isolating capacitors mounted between the two sections. The ISO124 contains 250 transistors.

7.1.1 Modulator

An input amplifier (A1, as shown in [Functional Block Diagram](#)) integrates the difference between the input current ($V_{IN}/200\text{ k}\Omega$) and a switched $\pm 100\text{-}\mu\text{A}$ current source. This current source is implemented by a switchable $200\text{-}\mu\text{A}$ source and a fixed $100\text{-}\mu\text{A}$ current sink. To understand the basic operation of the modulator, assume that $V_{IN} = 0\text{ V}$. The integrator will ramp in one direction until the comparator threshold is exceeded. The comparator and sense amp will force the current source to switch; the resultant signal is a triangular waveform with a 50% duty cycle. The internal oscillator forces the current source to switch at 500 kHz. The resultant capacitor drive is a complementary duty-cycle modulation square wave.

7.1.2 Demodulator

The sense amplifier detects the signal transitions across the capacitive barrier and drives a switched current source into integrator A2. The output stage balances the duty-cycle modulated current against the feedback current through the $200\text{-k}\Omega$ feedback resistor, resulting in an average value at the V_{OUT} pin equal to V_{IN} . The sample-and-hold amplifiers in the output feedback loop serve to remove undesired ripple voltages inherent in the demodulation process.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Carrier Frequency Considerations

The ISO124 amplifier transmits the signal across the isolation barrier by a 500-kHz duty-cycle modulation technique. For input signals having frequencies below 250 kHz, this system works like any linear amplifier. But for frequencies above 250 kHz, the behavior is similar to that of a sampling amplifier. [Figure 9](#) shows this behavior graphically; at input frequencies above 250 kHz, the device generates an output signal component of reduced magnitude at a frequency below 250 kHz. This is the aliasing effect of sampling at frequencies less than two times the signal frequency (the Nyquist frequency). At the carrier frequency and its harmonics, both the frequency and amplitude of the aliasing go to zero.

8.1.2 Isolation Mode Voltage Induced Errors

IMV can induce errors at the output as indicated by the plots of IMV vs Frequency. It should be noted that if the IMV frequency exceeds 250 kHz, the output also will display spurious outputs (aliasing) in a manner similar to that for $V_{IN} > 250$ kHz and the amplifier response will be identical to that shown in [Figure 9](#). This occurs because IMV-induced errors behave like input-referred error signals. To predict the total error, divide the isolation voltage by the IMR shown in [Figure 11](#) and compute the amplifier response to this input-referred error signal from the data shown in [Figure 9](#). For example, if a 800-kHz 1000-Vrms IMR is present, then a total of $[(-60 \text{ dB}) + (-30 \text{ dB})] \times (1000 \text{ V}) = 32\text{-mV}$ error signal at 200 kHz plus a 1-V, 800-kHz error signal will be present at the output.

8.1.3 High IMV dV/dt Errors

As the IMV frequency increases and the dV/dt exceeds 1000 V/ μ s, the sense amp may start to false trigger, and the output will display spurious errors. The common-mode current being sent across the barrier by the high slew rate is the cause of the false triggering of the sense amplifier. Lowering the power-supply voltages below ± 15 V may decrease the dV/dt to 500 V/Ms for typical performance.

8.1.4 High Voltage Testing

TI has adopted a partial discharge test criterion that conforms to the German VDE0884 Optocoupler Standards. This method requires the measurement of minute current pulses (< 5 pC) while applying 2400-Vrms, 60-Hz high-voltage stress across every ISO124 isolation barrier. No partial discharge may be initiated to pass this test. This criterion confirms transient overvoltage (1.6×1500 Vrms) protection without damage to the ISO124. Lifetest results verify the absence of failure under continuous rated voltage and maximum temperature.

This new test method represents the “state-of-the art” for nondestructive high-voltage reliability testing. It is based on the effects of nonuniform fields that exist in heterogeneous dielectric material during barrier degradation. In the case of void nonuniformities, electric field stress begins to ionize the void region before bridging the entire high-voltage barrier. The transient conduction of charge during and after the ionization can be detected externally as a burst of 0.01–0.1- μ s current pulses that repeat on each ac voltage cycle. The minimum ac barrier voltage that initiates partial discharge is defined as the “inception voltage.” Decreasing the barrier voltage to a lower level is required before partial discharge ceases and is defined as the “extinction voltage.” The package insulation processes have been characterized and developed to yield an inception voltage in excess of 2400 Vrms so that transient overvoltages below this level will not damage the ISO124. The extinction voltage is above 1500 Vrms so that even overvoltage induced partial discharge will cease once the barrier voltage is reduced to the 1500-Vrms (rated) level. Older high-voltage test methods relied on applying a large enough overvoltage (above rating) to break down marginal parts, but not so high as to damage good ones. Our new partial discharge testing gives us more confidence in barrier reliability than breakdown/no breakdown criteria.

8.2 Typical Applications

8.2.1 Output Filters

For more information concerning output filters, see [Simple Output Filter Eliminates ISO Amp Output Ripple and Keeps Full Bandwidth](#) and [FilterPro™ MFB and Sallen-Key Low-Pass Filter Design Program User Guide](#).

Figure 10. ISO124 With Output Filter for Improved Ripple

8.2.1.1 Design Requirements

The ISO124 isolation amplifiers (ISO amps) have a small (10 to 20 mVp-p typical) residual demodulator ripple at the output. A simple filter can be added to eliminate the output ripple without decreasing the 50kHz signal bandwidth of the ISO amp.

8.2.1.2 Detailed Design Procedure

The ISO124 device is designed to have a 50-kHz single-pole (Butterworth) signal response. By cascading the ISO amp with a simple 50-kHz, $Q = 1$, two-pole, low-pass filter, the overall signal response becomes three-pole Butterworth. The result is a maximally flat 50-kHz magnitude response and the output ripple reduced below the noise level. [Figure 10](#) shows the complete circuit. The two-pole filter is a unity-gain Sallen-Key type consisting of A1, R1, R2, C1, and C2. The values shown give $Q = 1$ and f_{-3dB} bandwidth = 50 kHz. Because the op amp is connected as a unity-gain follower, gain and gain accuracy of the ISO amp are unaffected. Using a precision op amp such as the OPA602 also preserves the DC accuracy of the ISO amp.

Typical Applications (continued)

8.2.1.3 Application Curves

- 1) Standard ISO124 has 50kHz single-pole (Butterworth) response.
- 2) ISO124 with cascaded 50kHz, $Q = 1$, two-pole, low-pass filter has three-pole Butterworth response.

Figure 11. Gain vs. Frequency

Typical Applications (continued)

8.2.2 Battery Monitor

Figure 17 provides a means to monitor the cell voltage on a 600-V battery stack by using the battery as a power source for the isolated voltage.

(Derives input power from the battery.)

Figure 17. Battery Monitor for a 600-V Battery Power System

Typical Applications (continued)

8.2.3 Programmable Gain Amplifier

In applications where variable gain configurations are required, a programmable gain amplifier like the PGA102 can be used with the ISO124 device. Figure 18 uses an ISO150 device to provide gain pin selection options to the PGA102 device.

Figure 18. Programmable-Gain Isolation Channel With Gains of 1, 10, and 100

Typical Applications (continued)

8.2.4 Thermocouple Amplifier

For isolated temperature measurements, Figure 19 provides an application solution using the INA114 or INA128 devices, feeding the input stage of the ISO124 device. The table provides suggested resistor values based on the type of thermistor used in the application.

Figure 19. Thermocouple Amplifier With Ground Loop Elimination, Cold Junction Compensation, and Up-scale Burn-out

Typical Applications (continued)

8.2.5 Isolated 4-mA to 20-mA Instrument Loop

For isolated temperature measurements in a 4-mA to 20-mA loop, [Figure 20](#) provides a solution using the XTR101 and RCV420 devices. A high-performance PT100 resistance temperature detector (RTD) provides the user with an isolated 0-V to 5-V representation of the isolated temperature measurement.

Figure 20. Isolated 4- to 20-mA Instrument Loop (RTD Shown)

8.2.6 Single-Supply Operation of the ISO124 Isolation Amplifier

The circuit shown in [Figure 21](#) uses a 5.1-V Zener diode to generate the negative supply for an ISO12x from a single supply on the high-voltage side of the isolation amplifier. The input measuring range will be dependent on the applied voltage as noted in the accompanying table.

NOTE: Because the amplifier is unity gain, the input range is also the output range. The output can go to -2 V because the output section of the ISO amp operates from dual supplies.

For additional information see [Single-Supply Operation of Isolation Amplifiers](#).

Figure 21. Single-Supply Operation of the ISO124 Isolation Amplifier Schematic

Typical Applications (continued)

8.2.7 Input-Side Powered ISO Amplifier

The user side of the ISO124 device can be powered from the high voltage side using an isolated DC-DC converter as shown in [Figure 22](#).

Figure 22. Input-Side Powered ISO Amplifier Schematic

Typical Applications (continued)

8.2.8 Powered ISO Amplifier With Three-Port Isolation

Figure 23 illustrates an application solution that provides isolated power to both the user and high-voltage sides of the ISO124 amplifier.

Figure 23. Powered ISO Amplifier With Three-Port Isolation Schematic

9 Power Supply Recommendations

9.1 Signal and Supply Connections

Each power-supply pin should be bypassed with 1- μ F tantalum capacitors located as close to the amplifier as possible. The internal frequency of the modulator/demodulator is set at 500 kHz by an internal oscillator. Therefore, if it is desired to minimize any feedthrough noise (beat frequencies) from a DC-DC converter, use a π filter on the supplies (see Figure 10). The ISO124 output has a 500-kHz ripple of 20 mV, which can be removed with a simple 2-pole low-pass filter with a 100-kHz cutoff using a low-cost op amp (see Figure 10).

The input to the modulator is a current (set by the 200-k Ω integrator input resistor) that makes it possible to have an input voltage greater than the input supplies, as long as the output supply is at least ± 15 V. It is therefore possible, when using an unregulated DC-DC converter, to minimize PSR related output errors with ± 5 -V voltage regulators on the isolated side and still get the full ± 10 -V input and output swing.

Figure 24. Basic Signal and Power Connections

10 Layout

10.1 Layout Guidelines

To maintain the isolation barrier of the device, the distance between the high-side ground (pin 16 or 28) and the low-side ground (pin 8 or 14) should be kept at maximum; that is, the entire area underneath the device should be kept free of any conducting materials.

10.2 Layout Example

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

DVA (R-PDSO-G8/28)

PLASTIC SMALL-OUTLINE

NOTES: A. All linear dimensions are in millimeters.

B. This drawing is subject to change without notice.

C. Body length dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, and gate burrs shall not exceed 0,15 mm per side.

D. Body width dimension does not include inter-lead flash or protrusions. Inter-lead flash and protrusions shall not exceed 0,25 mm per side.

E. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the cross-hatched area.

F. Lead dimension is the length of terminal for soldering to a substrate.

G. Lead width, as measured 0,36 mm or greater above the seating plane, shall not exceed a maximum value of 0,61 mm.

H. Lead-to-lead coplanarity shall be less than 0,10 mm from seating plane.

I. Falls within JEDEC MS-013-AE with the exception of the number of leads.

NVF (R-PDIP-T8/16)

PLASTIC DUAL-IN-LINE

- A. All linear dimensions are in inches (millimeters).
 B. This drawing is subject to change without notice.
 C. Falls within JEDEC MS-001-BB with the exception of lead count.

D. Dimensions do not include mold flash or protrusions.
 Mold flash or protrusions shall not exceed 0.010 (0,25).

E. Dimensions measured with the leads constrained to be perpendicular to Datum C.

F. Dimensions are measured at the lead tips with the leads unconstrained.

- G. A visual index feature must be located within the cross-hatched area.

重要声明和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。
