ISO782xLL 高性能 8000 V_{PK} 增强型隔离式双 LVDS 缓冲器

1 特性

- 符合 TIA/EIA-644-A LVDS 标准
- 信号传输速率：高达 100Mbps
- 宽电源电压范围：2.25V 至 5.5V
- 宽环境温度范围：-55°C 至 +125°C
- 低功耗，100Mbps 时每通道的电流：
  - 典型值 9.3mA (ISO7820LL)
  - 典型值 9.5mA (ISO7821LL)
- 低传播延迟：17ns（典型值）
- 行业领先的 CMTI（最小值）：±100kV/μs
- 优异的电磁兼容性 (EMC)
- 系统级静电放电 (ESD)、瞬态放电 (EFT) 以及抗浪涌保护
- 低辐射
- 隔离栅寿命：> 40 年
- 提供宽体和超宽体 SOIC-16 封装
- 可承受的隔离浪涌电压高达 12800 V_{PK}
- 安全相关认证：
  - 符合 DIN V VDE V 0884-10 (VDE V 0884-10):2006-12 标准的 8000 V_{PK}
  - 符合 UL 1577 标准且长达 1 分钟的 5700 V_{RMS} 隔离
  - CSA 组件验收通知 5A，IEC 60950-1 和 IEC 60601-1 终端设备标准
  - 符合 EN 61010-1 和 EN 60950-1 标准的 TUV 认证
  - GB4943.1-2011 CQC 认证
  - 已通过所有认证

2 应用

- 电机控制
- 测试和测量
- 工业自动化
- 医疗设备
- 通信系统

3 说明

ISO782xLL 系列器件是高性能隔离式双路 LVDS 缓冲器，隔离电压高达 8000V_{PK}。在隔离 LVDS 总线信号时，该器件可提供高电磁抗扰度，辐射较低，并且具有低功耗特性。每条隔离通道的 LVDS 接收和发送缓冲器均由二氧化硅 (SiO_2) 绝缘栅相隔离。

ISO7820LL 器件有两个正向通道。ISO7821LL 器件有一条正向通道和一条反向通道。

凭借创新型芯片设计和布线技术，ISO782xLL系列器件的电磁兼容性得到了显著增强，可缓解系统级 ESD、EFT 和浪涌问题并符合辐射标准。

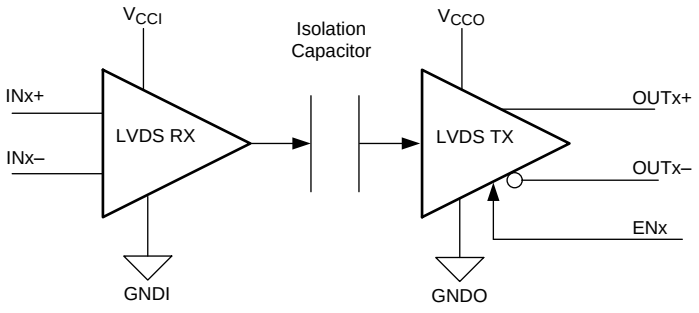

ISO782xLL 系列器件提供 16 引脚 SOIC 宽体 (DW) 和超宽体 (DWW) 两种封装。

器件信息(1)

器件型号	封装	封装尺寸（标称值）
ISO7820LL ISO7821LL	DW (16)	10.30mm x 7.50mm
	DWW (16)	10.30mm x 14.00mm

(1) 要了解所有可用封装，请见数据表末尾的可订购产品附录。

简化电路原理图

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

			MIN	MAX	UNIT
V_{CCx}	Supply voltage(2)	V_{CC1}, V_{CC2}	–0.5	6	V
V	Voltage on input, output, and enable pins	OUTx, INx, ENx	–0.5	V_{CCx} + 0.5(3)	V
I_O	Maximum current through OUTx pins		–20	20	mA
T_J	Junction temperature		–55	150	°C
T_{stg}	Storage temperature		–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values except differential I/O bus voltages are with respect to the local ground terminal (GND1 or GND2) and are peak voltage values.
(3) Maximum voltage must not exceed 6 V.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±4500	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±1500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

			MIN	NOM	MAX	UNIT
V_{CC1}, V_{CC2}	Supply voltage		2.25	3.3	5.5	V
$\|V_{ID}\|$	Magnitude of RX input differential voltage	Driven with voltage sources on RX pins	100		600	mV
V_{IC}	RX input common-mode voltage	V_{CC1}, V_{CC2} ≥ 3 V	0.5 $\|V_{ID}\|$		2.4 – 0.5 $\|V_{ID}\|$	V
		V_{CC1}, V_{CC2} < 3 V	0.5 $\|V_{ID}\|$		V_{CCx} – 0.6 – 0.5 $\|V_{ID}\|$	V
R_L	TX far end differential termination			100		Ω
DR	Signaling rate		0		100	Mbps
T_A	Ambient temperature		–55	25	125	°C

Copyright © 2016, Texas Instruments Incorporated

6.4 Thermal Information

THERMAL METRIC[1]		ISO7820LL ISO7821LL		UNIT
		DW (SOIC)	DWW (SOIC)	
		16 PINS	16 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	82	84.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case(top) thermal resistance	44.6	46.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	46.6	55.3	°C/W
ψ_{JT}	Junction-to-top characterization parameter	17.8	18.7	°C/W
ψ_{JB}	Junction-to-board characterization parameter	46.1	54.5	°C/W
$R_{\theta JC(bottom)}$	Junction-to-case(bottom) thermal resistance	—	—	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

6.5 Power Ratings

V_{CC1} = V_{CC2} = 5.5 V, T_J = 150°C, C_L = 5 pF, input a 50-MHz 50% duty-cycle square wave, EN1 = EN2 = 5.5 V, R_L = 100-Ω differential

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
ISO7821LL						
P_D	Maximum power dissipation (both sides)				156	mW
P_{D1}	Maximum power dissipation (side 1)				78	mW
P_{D2}	Maximum power dissipation (side 2)				78	mW
ISO7820LL						
P_D	Maximum power dissipation (both sides)				152	mW

6.6 Insulation Specifications

over operating free-air temperature range (unless otherwise noted)(1)

PARAMETER		TEST CONDITIONS	SPECIFICATION		UNIT
			DW	DWW	
GENERAL					
CLR	External clearance(1)	Shortest terminal-to-terminal distance through air	>8	>14.5	mm
CPG	External creepage(1)	Shortest terminal-to-terminal distance across the package surface	>8	>14.5	mm
DTI	Distance through the insulation	Minimum internal gap (internal clearance)	>21	>21	μm
CTI	Tracking resistance (comparative tracking index)	DIN EN 60112 (VDE 0303–11); IEC 60112; UL 746A	>600	>600	V
	Material group	According to IEC 60664-1	I	I	
	Overvoltage category per IEC 60664-1	Rated mains voltage ≤ 600 V_{RMS}	I–IV	I–IV	
		Rated mains voltage ≤ 1000 V_{RMS}	I–III	I–IV	
DIN V VDE V 0884–10 (VDE V 0884–10):2006–12(2)					
V_{IORM}	Maximum repetitive peak isolation voltage	AC voltage (bipolar)	2121	2828	V_{PK}
V_{IOWM}	Maximum isolation working voltage	AC voltage (sine wave); time dependent dielectric breakdown (TDDB) test; see Figure 1 and Figure 2	1500	2000	V_{RMS}
		DC voltage	2121	2828	V_{DC}
V_{IOTM}	Maximum transient isolation voltage	$V_{TEST} = V_{IOTM}$ t = 60 s (qualification) t = 1 s (100% production)	8000	8000	V_{PK}
V_{IOSM}	Maximum surge isolation voltage(3)	Test method per IEC 60065, 1.2/50 μs waveform, $V_{TEST} = 1.6 \times V_{IOSM} = 12800\ V_{PK}$ (qualification)	8000	8000	V_{PK}
q_{pd}	Apparent charge(4)	Method a: After I/O safety test subgroup 2/3, $V_{ini} = V_{IOTM}$, t_{ini} = 60 s; $V_{pd(m)} = 1.2 \times V_{IORM} = 2545\ V_{PK}$ (DW) and 3394 V_{PK} (DWW), t_m = 10 s	≤5	≤5	pC
		Method a: After environmental tests subgroup 1, $V_{ini} = V_{IOTM}$, t_{ini} = 60 s; $V_{pd(m)} = 1.6 \times V_{IORM} = 3394\ V_{PK}$ (DW) and 4525 V_{PK} (DWW), t_m = 10 s	≤5	≤5	
		Method b1: At routine test (100% production) and preconditioning (type test) $V_{ini} = V_{IORM}$, t_{ini} = 1 s; $V_{pd(m)} = 1.875 \times V_{IORM} = 3977\ V_{PK}$ (DW) and 5303 V_{PK} (DWW), t_m = 1 s	≤5	≤5	
C_{IO}	Barrier capacitance, input to output(5)	V_{IO} = 0.4 × sin (2πft), f = 1 MHz	~0.7	~0.7	pF
R_{IO}	Isolation resistance, input to output(5)	V_{IO} = 500 V, T_A = 25°C	$>10^{12}$	$>10^{12}$	Ω
		V_{IO} = 500 V, 100°C ≤ T_A ≤ 125°C	$>10^{11}$	$>10^{11}$	
		V_{IO} = 500 V at T_S = 150°C	$>10^9$	$>10^9$	
	Pollution degree		2	2	
	Climatic category		55/125/21	55/125/21	
UL 1577					
V_{ISO}	Withstanding isolation voltage	$V_{TEST} = V_{ISO} = 5700\ V_{RMS}$, t = 60 s (qualification); $V_{TEST} = 1.2 \times V_{ISO} = 6840\ V_{RMS}$, t = 1 s (100% production)	5700	5700	V_{RMS}

(1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.
(2) This coupler is suitable for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
(3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
(4) Apparent charge is electrical discharge caused by a partial discharge (pd).
(5) All pins on each side of the barrier tied together creating a two-terminal device.

Certification planned	Certification planned	Certification planned	Certification planned	Certification planned

6.8 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier potentially leading to secondary system failures.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
DW PACKAGE						
I_S	Safety input, output, or supply current	$R_{\theta JA}$ = 82°C/W, V_I = 5.5 V, T_J = 150°C, T_A = 25°C, see Figure 3			277	mA
		$R_{\theta JA}$ = 82°C/W, V_I = 3.6 V, T_J = 150°C, T_A = 25°C, see Figure 3			423	
		$R_{\theta JA}$ = 82°C/W, V_I = 2.75 V, T_J = 150°C, T_A = 25°C, see Figure 3			554	
P_S	Safety input, output, or total power	$R_{\theta JA}$ = 82°C/W, T_J = 150°C, T_A = 25°C, see Figure 5			1524	mW
T_S	Maximum safety temperature				150	°C
DWW PACKAGE						
I_S	Safety input, output, or supply current	$R_{\theta JA}$ = 84.6°C/W, V_I = 5.5 V, T_J = 150°C, T_A = 25°C, see Figure 4			269	mA
		$R_{\theta JA}$ = 84.6°C/W, V_I = 3.6 V, T_J = 150°C, T_A = 25°C, see Figure 4			410	
		$R_{\theta JA}$ = 84.6°C/W, V_I = 2.75 V, T_J = 150°C, T_A = 25°C, see Figure 4			537	
P_S	Safety input, output, or total power	$R_{\theta JA}$ = 84.6°C/W, T_J = 150°C, T_A = 25°C, see Figure 6			1478	mW
T_S	Maximum safety temperature				150	°C

The maximum safety temperature is the maximum junction temperature specified for the device. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the *Thermal Information* is that of a device installed on a High-K test board for leaded surface-mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

8 Detailed Description

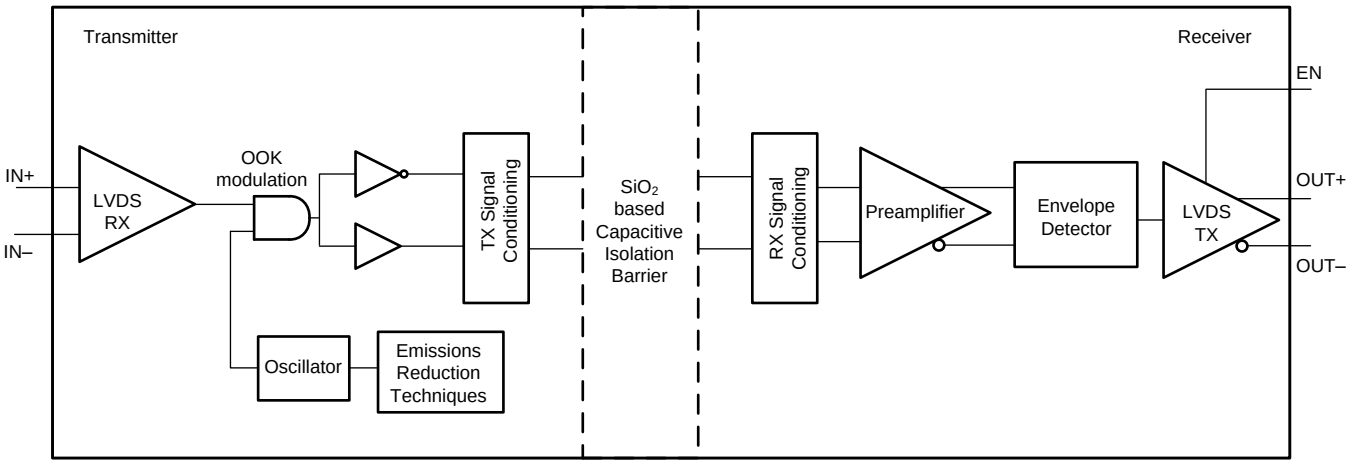

8.1 Overview

The ISO782xLL is a family of isolated LVDS buffers. The differential signal received on the LVDS input pins is first converted to CMOS logic levels. The signal is then transmitted across a silicon-dioxide (SiO_2) based capacitive-isolation barrier using an on-off keying (OOK) modulation scheme. A high frequency carrier transmitted across the barrier represents one logic state and an absence of a carrier represents the other logic state. On the other side of the barrier a demodulator converts the OOK signal back to logic levels, which is then converted to LVDS outputs by a differential driver. These devices incorporate advanced circuit techniques to maximize CMTI performance and minimize radiated emissions.

The ISO782xLL family of devices is TIA/EIA-644-A standard compliant. The LVDS transmitters drive a minimum differential-output voltage magnitude of 250 mV into a 100-Ω load, and the LVDS receivers are capable of detecting differential signals ≥50 mV in magnitude. The device consumes 10 mA per channel at 100 Mbps with 5-V supplies.

The *Functional Block Diagram* section shows a conceptual block diagram of one channel of the ISO782xLL family of devices.

8.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

8.3 Feature Description

The ISO782xLL family of devices is available in two channel configurations with a default differential high-output state.

PART NUMBER	CHANNEL DIRECTION	RATED ISOLATION	MAXIMUM DATA RATE	DEFAULT DIFFERENTIAL OUTPUT
ISO7820LL	2 Forward	5700 V_{RMS} / 8000 V_{PK} (1)	100 Mbps	High
ISO7821LL	1 Forward, 1 Reverse			

(1) See the *Safety-Related Certifications* section for detailed isolation ratings.

8.4 Device Functional Modes

Table 1 lists the functional modes for the ISO782xLL family of devices.

Table 1. ISO782xLL Function Table(1)

V_{CCI}	V_{CCO}	INPUT (INx±)(2)	OUTPUT ENABLE (ENx)	OUTPUT (OUTx±)(3)	COMMENTS
PU	PU	H	H or open	H	Normal Operation: A channel output assumes the logic state of the input.
		L	H or open	L	
		I	H or open	H or L	
X	PU	X	L	Z	A low-logic state at the output enable causes the outputs to be in high impedance.
PD	PU	X	H or open	H	Default mode: When V_{CCI} is unpowered, a channel output assumes the logic high state. When V_{CCI} transitions from unpowered to powered up, a channel output assumes the logic state of the input. When V_{CCI} transitions from powered up to unpowered, a channel output assumes the selected default high state.
X	PD	X	X	Undetermined	When V_{CCO} is unpowered, a channel output is undetermined. When V_{CCO} transitions from unpowered to powered-up, a channel output assumes the logic state of the input

(1) V_{CCI} = input-side V_{CC}; V_{CCO} = output-side V_{CC}; PU = powered up (V_{CCx} ≥ 2.25 V); PD = powered down (V_{CCx} ≤ 1.7 V); X = irrelevant
(2) Input (INx±): H = high level (V_{ID} ≥ 50 mV); L = low level (V_{ID} ≤ –50 mV); I = indeterminate (–50 mV < V_{ID} < 50 mV)
(3) Output (OUTx±): H = high level (V_{OD} ≥ 250 mV); L = low level (V_{OD} ≤ –250 mV); Z = high impedance.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The ISO782xLL is a family of high-performance, reinforced isolated dual-LVDS buffers. Isolation can be used to help achieve human and system safety, to overcome ground potential difference (GPD), or to improve noise immunity and system performance.

The LVDS signaling can be used over most interfaces to achieve higher data rates because the LVDS is only a physical layer. LVDS can also be used for a proprietary communication scheme implemented between a host controller and a slave. Example use cases include connecting a high-speed I/O module to a host controller, a subsystem connecting to a backplane, and connection between two high-speed subsystems. Many of these systems operate under harsh environments making them susceptible to electromagnetic interferences, voltage surges, electrical fast transients (EFT), and other disturbances. These systems must also meet strict limits on radiated emissions. Using isolation in combination with a robust low-noise signaling standard such as LVDS, achieves both high immunity to noise and low emissions.

Example end applications that could benefit from the ISO782xLL family of devices include high-voltage motor control, test and measurement, industrial automation, and medical equipment.

9.2 Typical Application

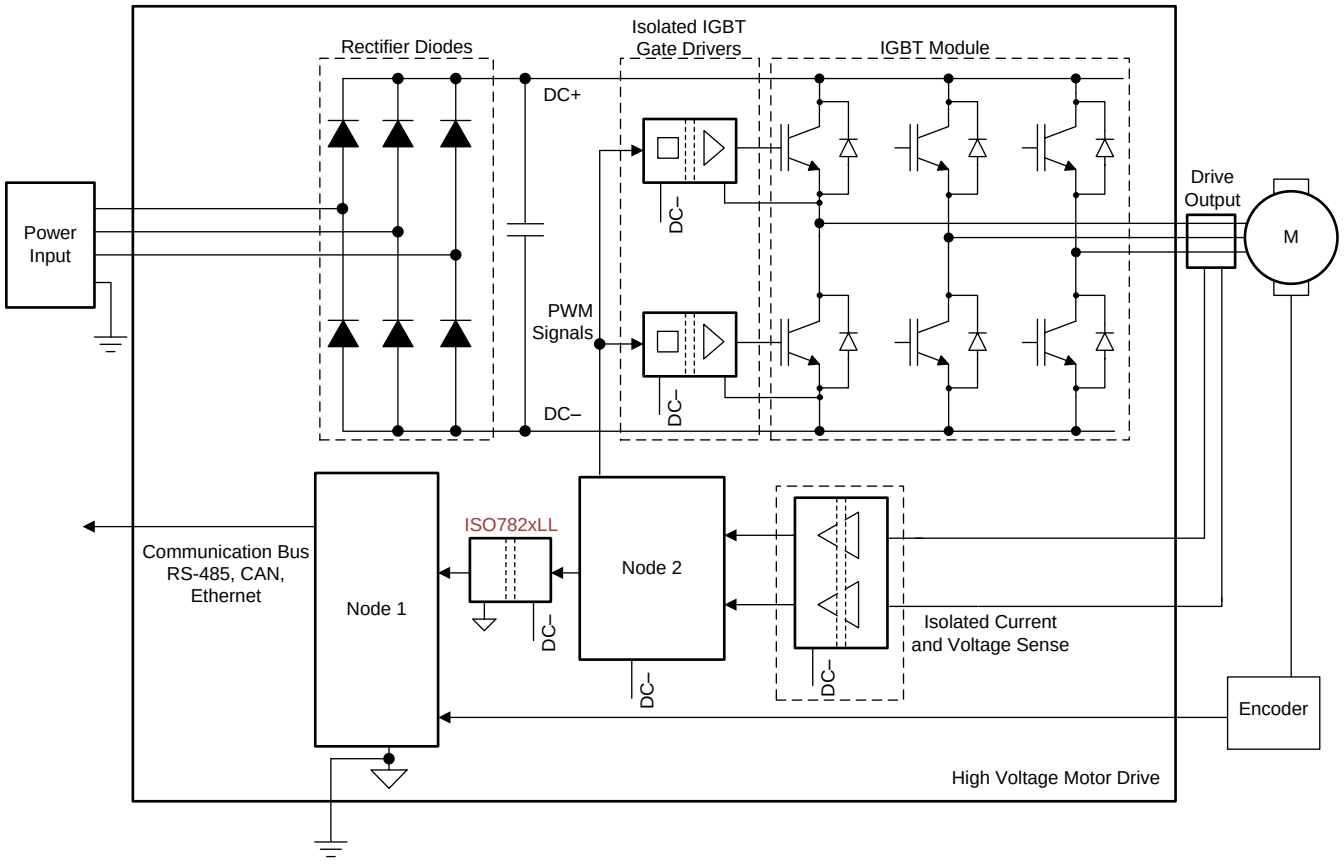

One application for isolated LVDS buffers is for point-to-point communication between two high-speed capable, application-specific integrated circuits (ASICs) or FPGAs. In a high-voltage motor control application, for example, Node 1 could be a controller on a low-voltage or earth referenced board, and Node 2, could be controller placed on the power board, biased to high voltage. Figure 29 and Figure 30 show the application schematics.

Figure 30 provides further details of using the ISO782xLL family of devices to isolate the LVDS interface. The LVDS connection to the ISO782xLL family of devices can be traces on a board (shown as straight lines between Node 1 and the ISO782xLL device), a twisted pair cable (as shown between Node 2 and the ISO782xLL device), or any other controlled impedance channel. Differential 100-Ω terminations are placed near each LVDS receiver. The characteristic impedance of the channel should also be 100-Ω differential.

In the example shown in Figure 29 and Figure 30, the ISO782xLL family of devices provides reinforced or safety isolation between the high-voltage elements of the motor drive and the low-voltage control circuitry. This configuration also ensures reliable communication, regardless of the high conducted and radiated noise present in the system.

Typical Application (continued)

9.2.1 Design Requirements

For the ISO782xLL family of devices, use the parameters listed in Table 2.

Table 2. Design Parameters

PARAMETER	VALUE
Supply voltage range, V_{CC1} and V_{CC2}	2.25 V to 5.5 V
Receiver common-mode voltage range	For $V_{CCx} \geq 3$ V: 0.5 $\lvert V_{ID}\rvert$ to 2.4 – 0.5 $\lvert V_{ID}\rvert$
	For $V_{CCx} < 3$ V: 0.5 $\lvert V_{ID}\rvert$ to V_{CCx} – 0.6 – 0.5 $\lvert V_{ID}\rvert$
External termination resistance	100 Ω
Interconnect differential characteristic impedance	100 Ω
Signaling rate	0 to 100 Mbps
Decoupling capacitor from V_{CC1} and GND1	0.1 µF
Decoupling capacitor from V_{CC2} and GND2	0.1 µF

9.2.2 Detailed Design Procedure

The ISO782xLL family of devices has minimum requirements on external components for correct operation. External bypass capacitors (0.1 µF) are required for both supplies (V_{CC1} and V_{CC2}). A termination resistor with a value of 100 Ω is required between each differential input pair (INx+ and INx–), with the resistors placed as close to the device pins as possible. A differential termination resistor with a value of 100 Ω is required on the far end for the LVDS transmitters. Figure 31 and Figure 32 show these connections.

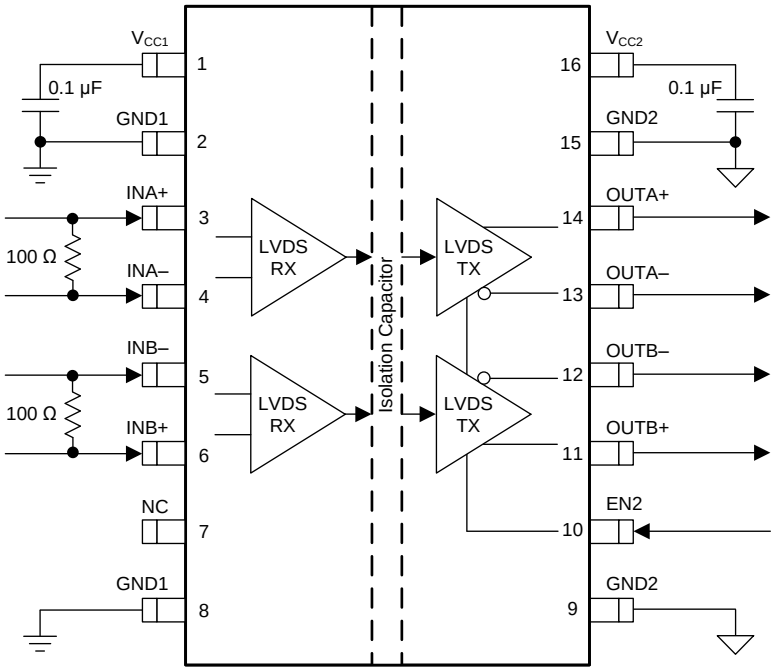

Figure 31. Typical ISO7820LL Circuit Hook-Up

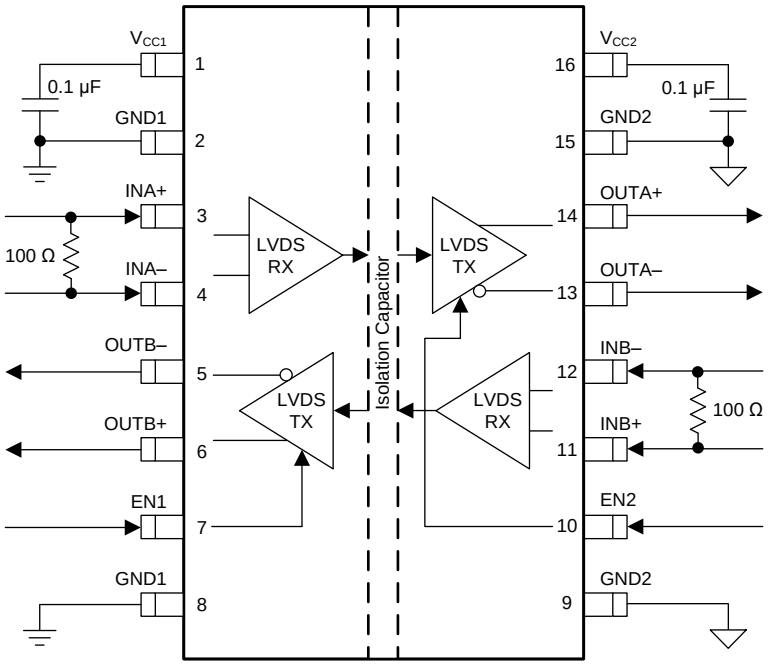

Figure 32. Typical ISO7821LL Circuit Hook-Up

9.2.2.1 Electromagnetic Compatibility (EMC) Considerations

Many applications in harsh industrial environment are sensitive to disturbances such as electrostatic discharge (ESD), electrical fast transient (EFT), surge and electromagnetic emissions. These electromagnetic disturbances are regulated by international standards such as IEC 61000-4-x and CISPR 22. Although system-level performance and reliability depends, to a large extent, on the application board design and layout, the ISO782xLL family of devices incorporates many chip-level design improvements for overall system robustness. Some of these improvements include:

- Robust ESD protection cells for input and output signal pins and inter-chip bond pads.
- Low-resistance connectivity of ESD cells to supply and ground pins.
- Enhanced performance of high voltage isolation capacitor for better tolerance of ESD, EFT and surge events.
- Bigger on-chip decoupling capacitors to bypass undesirable high energy signals through a low impedance path.
- PMOS and NMOS devices isolated from each other by using guard rings to avoid triggering of parasitic SCRs.
- Reduced common mode currents across the isolation barrier by ensuring purely differential internal operation.

9.2.3 Application Curve

Figure 33 shows a typical eye diagram of the ISO782xLL family of devices which indicates low jitter and a wide-open eye at the maximum data rate of 100 Mbps.

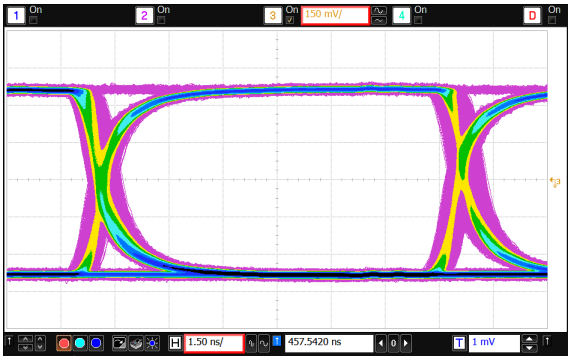

Figure 33. Eye Diagram at 100 Mbps PRBS, 3.3 V and 25°C

10 Power Supply Recommendations

To help ensure reliable operation at data rates and supply voltages, a 0.1-µF bypass capacitor is recommended at the input and output supply pins (V_{CC1} and V_{CC2}). The capacitors should be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as Texas Instruments' SN6501 or SN6505. For such applications, detailed power supply design and transformer selection recommendations are available in the following data sheets: *SN6501 Transformer Driver for Isolated Power Supplies* (SLLSEA0) and *SN6505 Low-Noise 1-A Transformer Drivers for Isolated Power Supplies* (SLLSEP9).

11 Layout

11.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see Figure 34). Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/in^2.
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.
- While routing differential traces on a board, TI recommends that the distance between two differential pairs be much higher (at least 2x) than the distance between the traces in a differential pair. This distance minimizes crosstalk between the two differential pairs.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

The ISO782xLL family of devices requires no special layout considerations to mitigate electromagnetic emissions.

For detailed layout recommendations, see the *Digital Isolator Design Guide* (SLLA284).

11.1.1 PCB Material

For digital circuit boards operating at less than 150 Mbps (or rise and fall times higher than 1 ns) and trace lengths of up to 10 inches, use standard FR–4 UL94V-0 epoxy-glass as PCB material. ThisPCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and self-extinguishing flammability-characteristics.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

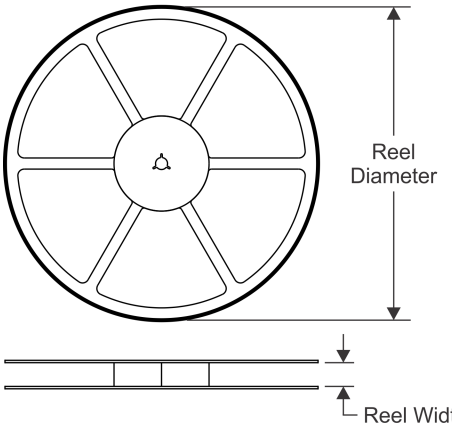

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

PACKAGE OUTLINE

DWW0016A

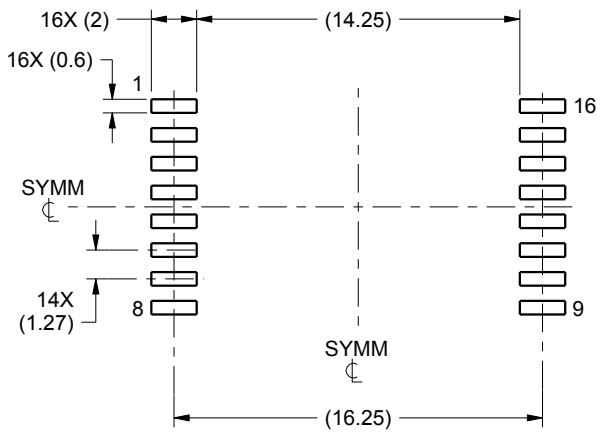

SOIC - 2.65 mm max height

PLASTIC SMALL OUTLINE

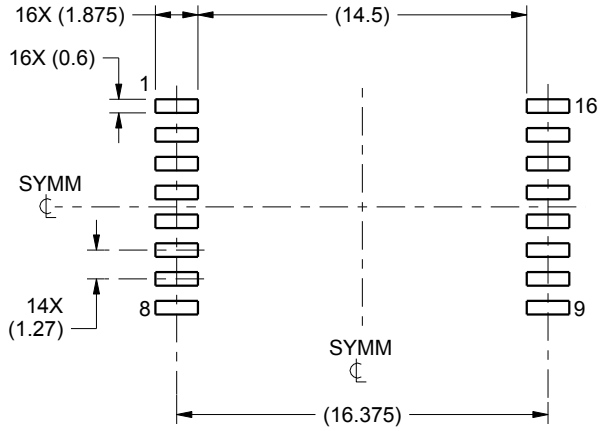

NOTES:

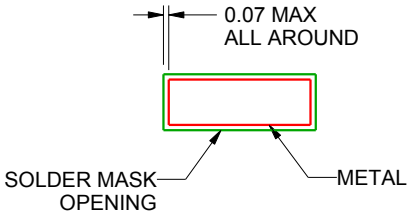

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 mm per side.
4. This dimension does not include interlead flash.
