

# 具有 2.5V 和 3.3V 输出的 CDCE813-Q1 可编程 1-PLL 时钟合成器和抖动消除器

## 1 特性

- 符合汽车 应用要求
- 具有符合 AEC-Q100 标准的下列特性：
  - 器件温度等级 2: -40°C 至 105°C 的环境工作温度范围
  - 器件 HBM ESD 分类等级 H2
  - 器件 CDM ESD 分类等级 C6
- 系统内可编程和 EEPROM
  - 串行可编程易失性寄存器
  - 用于存储客户设置的非易失性 EEPROM
- 灵活的输入计时理念
  - 外部晶体: 8MHz 至 32MHz
  - 高达 160MHz 的单端 LVCMOS
- 高达 230MHz 的自由可选输出频率
- 低噪声 PLL 内核
  - 已集成的 PLL 环路滤波器组件
  - 低电平周期抖动 (典型值 50ps)
- 1.8V 器件电源 (内核电压)
- 独立的输出电源引脚: 3.3V 和 2.5V
- 灵活的时钟驱动器
  - 三个用户可定义的控制输入 [S0、S1、S2], 例如 SSC 选择、频率切换、输出使能或断电
  - 生成适用于视频、音频、USB、IEEE1394 和 RFID、Bluetooth®、WLAN、以太网和 GPS 的高精度时钟
  - 生成可与 TI-DaVinci™、OMAP™ 和 DSP 配合使用的共同时钟频率
  - 可编程 SSC 调制
  - 启用 0-PPM 时钟生成功能
- 采用 TSSOP 封装
- 适用于简易 PLL 设计和编程的开发和编程套件 (TI ClockPro™ 编程软件)

## 2 应用

- 仪表组
- 音响主机
- 导航系统
- 高级驾驶辅助系统 (ADAS)

## 3 说明

CDCE813-Q1 器件是一款基于模块化锁相环 (PLL) 的低成本、高性能、可编程时钟合成器。它们最多可从单个输入频率中生成 3 个输出时钟。借助集成的可配置 PLL，可在系统内针对任何时钟频率 (高达 230MHz) 对每个输出进行编程。

CDCE813-Q1 具有独立的输出电源引脚  $V_{DDOUT}$ ，可提供 2.5V 至 3.3V 电压。

此输入接受外部晶振或 LVCMOS 时钟信号。凭借可选片载 VCXO，可将输出频率与外部控制信号同步。

PLL 支持 SSC (扩频时钟)，从而改善抗电磁干扰 (EMI) 性能。

器件信息<sup>(1)</sup>

| 器件型号       | 封装         | 封装尺寸 (标称值)      |
|------------|------------|-----------------|
| CDCE813-Q1 | TSSOP (14) | 5.00mm × 4.40mm |

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

## 4 修订历史记录

注：之前版本的页码可能与当前版本有所不同。

| Changes from Revision B (May 2018) to Revision C                                                                                        | Page |
|-----------------------------------------------------------------------------------------------------------------------------------------|------|
| 向数据表中添加了 CDCE813R02-Q1 可订购信息                                                                                                            | 1    |
| 添加了器件对比表                                                                                                                                | 1    |
| Added default configuration information to the S0 pin description                                                                       | 4    |
| Removed 'CDCE813-Q1' text from the $V_{DDOUT}$ pin description. The information applies to both CDCE813-Q1 and CDCE813R02-Q1 orderables | 4    |
| Added S0 pin information in the <i>Overview</i> section                                                                                 | 11   |
| Added S0 pin information to the <i>Default Device Configuration</i> section                                                             | 13   |
| Added <i>CDCE813R02-Q1 Default Configuration</i> graphic                                                                                | 14   |
| Changed S0 pin information in the <i>Factory Default Setting for Control Terminal Register</i> table note                               | 14   |
| Added Y1_ST1 default settings for the CDCE813-Q1 and CDCE813R02-Q1 orderables                                                           | 18   |
| Added Y1_1 default settings for the CDCE813-Q1 and CDCE813R02-Q1 orderables                                                             | 18   |

| Changes from Revision A (May 2018) to Revision B                                                                                                                                                                                                                   | Page |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|
| Changed the text in the <i>Default Device Configuration</i> section from: However the outputs are disabled by default and need to be turned on through I2C or with the S0 pin to: However the outputs are disabled by default and need to be turned on through I2C | 13   |
| Changed the <i>Factory Default Setting</i> table and <i>Default Configuration</i> graphic text to show that the Y1 outputs as 3-state when S0 = 1 or S0 = 0                                                                                                        | 14   |
| Changed the default value of the SLAVE_ADR 1:0 bits from: 00b to: 01b in the <i>Generic Configuration Register</i> table                                                                                                                                           | 18   |
| Changed the default value of the Y1_ST0 3:2 bits from: 11b to: 01b in the <i>Generic Configuration Register</i> table                                                                                                                                              | 18   |
| Changed the default value of the BCOUNT 7:1 bits from: 20h to: 00h in the <i>Generic Configuration Register</i> table                                                                                                                                              | 18   |
| Changed the default value of the Y2Y3_1 bit from: 1b to: 0b in the <i>PLL1 Configuration Register</i> table                                                                                                                                                        | 19   |

---

**Changes from Original (January 2017) to Revision A****Page**

- 
- Changed the *Factory Default Setting* table and *Default Configuration* graphic text to show that S0 = 1 means Y1 outputs 3-state and S0 = 0 means Y1 is enabled ..... 14
-

## 5 说明（续）

为了轻松实现器件自定义来满足应用需要，该器件支持使用非易失性 **EEPROM** 进行编程。所有器件设置均可通过 **I2C** 总线（一种两线制串行接口）进行编程。

**CDCE813-Q1** 在 1.8V 内核环境下运行，无需额外使用独立的 **XTAL** 振荡器，可减少组件数量并缩减电路板尺寸。它的运行温度范围为  $-40^{\circ}\text{C}$  至  $105^{\circ}\text{C}$ 。

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

|                    |                                                                       |            | MIN  | MAX                      | UNIT |
|--------------------|-----------------------------------------------------------------------|------------|------|--------------------------|------|
| V <sub>DD</sub>    | Supply voltage                                                        |            | −0.5 | 2.5                      | V    |
| V <sub>DDOUT</sub> | Output clocks supply voltage                                          | CDCE813-Q1 | −0.5 | 3.6 + 0.5                | V    |
| V <sub>I</sub>     | Input voltage <sup>(2)(3)</sup>                                       |            | −0.5 | V <sub>DD</sub> + 0.5    | V    |
| V <sub>O</sub>     | Output voltage <sup>(2)</sup>                                         |            | −0.5 | V <sub>DDOUT</sub> + 0.5 | V    |
| I <sub>I</sub>     | Input current (V <sub>I</sub> < 0, V <sub>I</sub> > V <sub>DD</sub> ) |            |      | 20                       | mA   |
| I <sub>O</sub>     | Continuous output current                                             |            |      | 50                       | mA   |
| T <sub>J</sub>     | Maximum junction temperature                                          |            |      | 125                      | °C   |
| T <sub>stg</sub>   | Storage temperature                                                   |            | −65  | 150                      |      |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The input and output negative voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
- (3) SDA and SCL can go up to 3.6 V as stated in the *Recommended Operating Conditions* table.

### 7.2 ESD Ratings

|                    |                         |                                                         | VALUE | UNIT |
|--------------------|-------------------------|---------------------------------------------------------|-------|------|
| V <sub>(ESD)</sub> | Electrostatic discharge | Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup> | ±2000 | V    |
|                    |                         | Charged-device model (CDM), per AEC Q100-011            | ±1500 |      |

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 7.3 Recommended Operating Conditions

|                                   |                                                                                      |                            | MIN                   | NOM                   | MAX                   | UNIT |
|-----------------------------------|--------------------------------------------------------------------------------------|----------------------------|-----------------------|-----------------------|-----------------------|------|
| V <sub>DD</sub>                   | Device supply voltage                                                                |                            | 1.7                   | 1.8                   | 1.9                   | V    |
| V <sub>O</sub>                    | Output Yx supply voltage, V <sub>DDOUT</sub>                                         | CDCE813-Q1                 | 2.3                   |                       | 3.6                   | V    |
| V <sub>IL</sub>                   | Low-level input voltage, LVCMOS                                                      |                            |                       |                       | 0.3 × V <sub>DD</sub> | V    |
| V <sub>IH</sub>                   | High-level input voltage, LVCMOS                                                     |                            | 0.7 × V <sub>DD</sub> |                       |                       | V    |
| V <sub>I(thresh)</sub>            | Input voltage threshold, LVCMOS                                                      |                            |                       | 0.5 × V <sub>DD</sub> |                       | V    |
| V <sub>I(S)</sub>                 | Input voltage range, S0                                                              |                            | 0                     |                       | 1.9                   | V    |
|                                   | Input voltage range S1, S2, SDA, SCL (V <sub>I(thresh)</sub> = 0.5 V <sub>DD</sub> ) |                            | 0                     |                       | 3.6                   |      |
| V <sub>I(CLK)</sub>               | Input voltage range CLK                                                              |                            | 0                     |                       | 1.9                   | V    |
| I <sub>OH</sub> , I <sub>OL</sub> | Output current                                                                       | V <sub>DDOUT</sub> = 3.3 V |                       |                       | ±12                   | mA   |
|                                   |                                                                                      | V <sub>DDOUT</sub> = 2.5 V |                       |                       | ±10                   |      |
| C <sub>L</sub>                    | Output load, LVCMOS                                                                  |                            |                       |                       | 15                    | pF   |
| T <sub>A</sub>                    | Operating ambient temperature                                                        |                            | −40                   |                       | 105                   | °C   |

## Recommended Operating Conditions (continued)

|                                                      |                                                                              | MIN       | NOM       | MAX      | UNIT     |
|------------------------------------------------------|------------------------------------------------------------------------------|-----------|-----------|----------|----------|
| <b>CRYSTAL AND VCXO SPECIFICATIONS<sup>(1)</sup></b> |                                                                              |           |           |          |          |
| $f_{Xtal}$                                           | Crystal input frequency range (fundamental mode)                             | 8         | 27        | 32       | MHz      |

## 9 Detailed Description

### 9.1 Overview

The CDCExxx-Q1 devices are modular PLL-based, low-cost, high-performance, programmable clock synthesizers, multipliers, and dividers. They generate up to three output clocks from a single input frequency. Each output can be programmed in-system for any clock frequency up to 230 MHz, using the integrated configurable PLL.

The CDCExxx-Q1 devices have separate output supply pins,  $V_{DDOUT}$ , with output of 2.5 V to 3.3 V.

The input accepts an external crystal or LVCMOS clock signal. If an external crystal is used, an on-chip load capacitor is adequate for most applications. The value of the load capacitor is programmable from 0 pF to 20 pF. Additionally, a selectable on-chip VCXO allows synchronization of the output frequency to an external control signal, that is, the PWM signal.

The deep M / N divider ratio allows the generation of zero-ppm audio-video, networking (WLAN, Bluetooth, Ethernet, GPS) or interface (USB, IEEE1394, memory stick) clocks from, for example, a 27-MHz reference input frequency.

The PLL supports spread-spectrum clocking (SSC). SSC can be center-spread or down-spread clocking, which is a common technique to reduce electromagnetic interference (EMI).

Based on the PLL frequency and the divider settings, the internal loop filter components are automatically adjusted to achieve high stability and optimized jitter transfer characteristics.

The device supports nonvolatile EEPROM programming for easy customization of the device to the application. It is preset to a factory default configuration (see [Default Device Configuration](#)). It can be reprogrammed to a different application configuration before PCB assembly, or reprogrammed by in-system programming. All device settings are programmable through the SDA-SCL bus, a 2-wire serial interface.

Three programmable control inputs, S0, S1, and S2, can be used to select different frequencies, change SSC setting for lowering EMI, or control other features like outputs disable to low, outputs in Hi-Z state, power down, PLL bypass, and so forth). For CDCE813-Q1, the S0 pin is unused by default. For the CDCE813R02-Q1, the S0 control input pin provides output enable (OE) control for output Y1 only.

The CDCE813-Q1 core operates in a 1.8-V environment. It operates in a temperature range of  $-40^{\circ}\text{C}$  to  $105^{\circ}\text{C}$ .

## 9.3 Feature Description

### 9.3.1 Control Terminal Configuration

The CDCE813-Q1 device has three user-definable control terminals (S0, S1, and S2), which allow external control of device settings. They can be programmed to any of the following functions:

- Spread-spectrum clocking selection → spread type and spread amount selection
- Frequency selection → switching between any of two user-defined frequencies
- Output state selection → output configuration and power-down control

The user can predefine up to eight different control settings. Table 1 and Table 2 explain these settings.

**Table 1. Control Terminal Definition**

| EXTERNAL CONTROL BITS | PLL1 SETTING            |               |                            | Y1 SETTING                         |
|-----------------------|-------------------------|---------------|----------------------------|------------------------------------|
| Control function      | PLL frequency selection | SSC selection | Output Y2 and Y3 selection | Output Y1 and power-down selection |

**Table 2. PLL1 Setting <sup>(1)</sup>**

| SSCx [3 BITS]                   |   |   | CENTER   | DOWN     |
|---------------------------------|---|---|----------|----------|
| SSC SELECTION (CENTER AND DOWN) |   |   |          |          |
| 0                               | 0 | 0 | 0% (off) | 0% (off) |
| 0                               | 0 | 1 | ±0.25%   | −0.25%   |
| 0                               | 1 | 0 | ±0.5%    | −0.5%    |
| 0                               | 1 | 1 | ±0.75%   | −0.75%   |
| 1                               | 0 | 0 | ±1.0%    | −1.0%    |
| 1                               | 0 | 1 | ±1.25%   | −1.25%   |
| 1                               | 1 | 0 | ±1.5%    | −1.5%    |
| 1                               | 1 | 1 | ±2.0%    | −2.0%    |

(1) Center and down-spread, Frequency0, Frequency1, State0, and State1 are user-definable in PLL1 configuration register.

**Table 3. PLL1 Setting, Frequency Selection <sup>(1)</sup>**

| FSx | FUNCTION    |
|-----|-------------|
| 0   | Frequency 0 |
| 1   | Frequency 1 |

(1) Frequency0 and Frequency1 can be any frequency within the specified  $f_{VCO}$  range.

**Table 4. PLL1 Setting, Output Selection (Y2, Y3) <sup>(1)</sup>**

| Y2, Y3 | FUNCTION |
|--------|----------|
| 0      | State 0  |
| 1      | State 1  |

(1) State0 or State1 selection is valid for both outputs of the corresponding PLL module and can be power down, Hi-Z state, low, or active.

**Table 5. Y1 Setting <sup>(1)</sup>**

| Y1 | FUNCTION |
|----|----------|
| 0  | State 0  |
| 1  | State 1  |

(1) State0 and State1 are user definable in the generic configuration register and can be power down, Hi-Z state, low, or active.

The S1/SDA and S2/SCL pins of the CDCE813-Q1 device are dual-function pins. In the default configuration, they are defined as SDA and SCL for the serial programming interface. They can be programmed as control pins (S1 and S2) by setting the appropriate bits in the EEPROM.

**NOTE**

Changes to the control register (Bit [6] of byte 02h) have no effect until they are written into the EEPROM.

Once they are set as control pins, the serial programming interface is no longer available. However, if  $V_{DDOUT}$  is forced to GND, the two control pins, S1 and S2, temporally act as serial programming pins (SDA and SCL).

S0 is *not* a multi-use pin; it is a control pin only.

### 9.3.2 Default Device Configuration

The internal EEPROM of the CDCE813-Q1 device is pre-configured with a factory default configuration as shown in Figure 5 (the input frequency is routed through PLL1 to the outputs as a default). This mode can be used to clean the jitter of an incoming clock signal. For the CDCE813-Q1, the outputs are disabled by default and must be turned on through I2C. For the CDCE813R02-Q1, output Y1 is enabled through the S0 control pin (active high), while outputs Y2 and Y3 are either in a tri-state condition or disabled by the register default. Y1 is enabled when S0 is floating because S0 has an internal pullup.

The default setting appears either after power is supplied or after a power-down – power-up sequence until it is reprogrammed by the user to a different application configuration. A new register setting is programmed through the serial I2C interface.

**Figure 5. CDCE813-Q1 Default Configuration**

Figure 6. CDCE813R02-Q1 Default Configuration

Table 6 shows the factory default setting for the Control Terminal Register.

#### NOTE

Even though eight different register settings are possible, in the default configuration, only the first two settings (0 and 1) can be selected with S0, as S1 and S2 are configured as programming pins in default mode.

Table 6. Factory Default Setting for Control Terminal Register <sup>(1)</sup>

| GPN           | EXTERNAL CONTROL PINS  |                        |    | Y1               | PLL1 SETTINGS       |               |                  |
|---------------|------------------------|------------------------|----|------------------|---------------------|---------------|------------------|
|               |                        |                        |    | OUTPUT SELECTION | FREQUENCY SELECTION | SSC SELECTION | OUTPUT SELECTION |
|               | S2                     | S1                     | S0 | Y1               | FS1                 | SSC1          | Y2Y3             |
| CDCE813-Q1    | SCL (I <sup>2</sup> C) | SDA (I <sup>2</sup> C) | 0  | 3-state          | f <sub>VC01_0</sub> | Off           | 3-state          |
|               | SCL (I <sup>2</sup> C) | SDA (I <sup>2</sup> C) | 1  | 3-state          | f <sub>VC01_0</sub> | Off           | 3-state          |
| CDCE813R02-Q1 | SCL (I <sup>2</sup> C) | SDA (I <sup>2</sup> C) | 0  | 3-state          | f <sub>VC01_0</sub> | Off           | 3-state          |
|               | SCL (I <sup>2</sup> C) | SDA (I <sup>2</sup> C) | 1  | Enabled          | f <sub>VC01_0</sub> | Off           | 3-state          |

(1) In default mode or when programmed respectively, S1 and S2 act as serial programming interface, I<sup>2</sup>C. They do not have any control-pin function but they are internally interpreted as if S1 = 0 and S2 = 0. For the CDCE813-Q1, S0 is an unused control pin by default. For the CDCE813R02-Q1, S0 provides output enable (OE) control output Y1 only.

### 9.3.3 I<sup>2</sup>C Serial Interface

The CDCE813-Q1 device operates as a slave device on the 2-wire serial I<sup>2</sup>C bus compatible with the popular SMBus or I<sup>2</sup>C specification. It operates in the standard-mode transfer (up to 100 kbps) and fast-mode transfer (up to 400 kbps) and supports 7-bit addressing.

The S1/SDA and S2/SCL pins of the CDCE813-Q1 device are dual-function pins. In the default configuration, they are used as the I<sup>2</sup>C serial programming interface. They can be reprogrammed as general-purpose control pins, S1 and S2, by changing the corresponding EEPROM setting, byte 02h, bit [6].

### 9.3.4 Data Protocol

The device supports *Byte Write and Byte Read* and *Block Write and Block Read* operations.

For *Byte Write/Read* operations, the system controller can individually access addressed bytes.

For *Block Write/Read* operations, the bytes are accessed in sequential order from lowest to highest byte (with most-significant bit first) with the ability to stop after any complete byte has been transferred. The numbers of bytes read out are defined by Byte Count in the generic configuration register. At the *Block Read* instruction, all bytes defined in Byte Count must be read out to finish the read cycle correctly.

Once a byte has been sent, it is written into the internal register and is effective immediately. This applies to each transferred byte, regardless of whether this is a *Byte Write* or a *Block Write* sequence.

If the EEPROM write cycle is initiated, the internal SDA registers are written into the EEPROM. During this write cycle, data is not accepted at the I2C bus until the write cycle is completed. However, data can be read out during the programming sequence (*Byte Read* or *Block Read*). The programming status can be monitored by *EEPIP*, byte 01h–bit 6.

The offset of the indexed byte is encoded in the command code, as described in [Table 7](#).

**Table 7. Slave Receiver Address (7 Bits)**

| DEVICE     | A6 | A5 | A4 | A3 | A2 | A1 <sup>(1)</sup> | A0 <sup>(1)</sup> | R/W |
|------------|----|----|----|----|----|-------------------|-------------------|-----|
| CDCE813-Q1 | 1  | 1  | 0  | 0  | 1  | 0                 | 1                 | 1/0 |
| CDCEx925   | 1  | 1  | 0  | 0  | 1  | 0                 | 0                 | 1/0 |
| CDCEx937   | 1  | 1  | 0  | 1  | 1  | 0                 | 1                 | 1/0 |
| CDCEx949   | 1  | 1  | 0  | 1  | 1  | 0                 | 0                 | 1/0 |

(1) Address bits A0 and A1 are programmable through the I2C bus (byte 01, bits [1:0]). This allows addressing up to 4 devices connected to the same I2C bus. The least-significant bit of the address byte designates a write or read operation.

## 9.4 Device Functional Modes

### 9.4.1 SDA and SCL Hardware Interface

[Figure 7](#) shows how the CDCE813-Q1 clock synthesizer is connected to the I2C serial interface bus. Multiple devices can be connected to the bus, but it may be necessary to reduce the speed (400 kHz is the maximum) if many devices are connected.

Note that the pullup resistors ( $R_p$ ) depend on the supply voltage, bus capacitance, and number of connected devices. The recommended pullup value is 4.7 k $\Omega$ . The resistor must meet the minimum sink current of 3 mA at  $V_{OLmax} = 0.4$  V for the output stages (for more details see the SMBus or I<sup>2</sup>C Bus specifications in the [Timing Requirements](#) table).

## 9.6 Register Maps

### 9.6.1 I2C Configuration Registers

The clock input, control pins, PLLs, and output stages are user configurable. The following tables and explanations describe the programmable functions of the CDCE813-Q1 device. All settings can be manually written into the device through the I2C bus or easily programmed by using the TI ClockPro™ programming software. The TI ClockPro™ programming software allows the user to make all settings quickly, and automatically calculates the values for optimized performance at lowest jitter.

**Table 9. I2C Registers**

| ADDRESS OFFSET | REGISTER DESCRIPTION           | TABLE                    |
|----------------|--------------------------------|--------------------------|
| 00h            | Generic configuration register | <a href="#">Table 11</a> |
| 10h            | PLL1 configuration register    | <a href="#">Table 12</a> |

The grey-highlighted bits, described in the configuration register tables in the following pages, belong to the control terminal register. The user can predefine up to eight different control settings. These settings then can be selected by the external control pins, S0, S1, and S2. See the [Control Terminal Configuration](#) section.

**Table 10. Configuration Register, External Control Terminals**

|   | EXTERNAL CONTROL PINS         |    |    | Y1               | PLL1 SETTINGS       |               |                  |
|---|-------------------------------|----|----|------------------|---------------------|---------------|------------------|
|   |                               |    |    | OUTPUT SELECTION | FREQUENCY SELECTION | SSC SELECTION | OUTPUT SELECTION |

- (2) All data transferred with the MSB first
- (3) Unless customer-specific setting
- (4) During EEPROM programming, no data is allowed to be sent to the device through the I2C bus until the programming sequence is completed. Data, however, can be read out during the programming sequence (*Byte Read* or *Block Read*).
- (5) If this bit is set to high in the EEPROM, the actual data in the EEPROM is permanently locked. No further programming is possible. Data, however can still be written through the I2C bus to the internal register to change device function on the fly, but new data can no longer be saved to the EEPROM. EELock is effective only if written into the EEPROM.
- (6) Selection of *control pins* is effective only if written into the EEPROM. Once written into the EEPROM, the serial programming pins are no longer available. However, if  $V_{DDOUT}$  is forced to GND, the two control pins, S1 and S2, temporarily act as serial programming pins (SDA-SCL), and the two slave receiver address bits are reset to A0 = 0 and A1 = 0.
- (7) These are the bits of the control terminal register (see [Table 10](#)). The user can predefine up to eight different control settings. These settings then can be selected by the external control pins, S0, S1, and S2.
- (8) The internal load capacitor (C1, C2) must be used to achieve the best clock performance. External capacitors should be used only to finely adjust  $C_L$  by a few picofarads. The value of  $C_L$  can be programmed with a resolution of 1 pF for a crystal load range of 0 pF to 20 pF. For  $C_L > 20$  pF, use additional external capacitors. The device input capacitance value must be considered, which always adds 1.5 pF (6 pF//2 pF) to the selected  $C_L$ . For more about VCXO configuring and crystal recommendation, see application report [VCXO Application Guideline for CDCE\(L\)9xx Family](#) (SCAA085).

| 07h-0Fh               |                    | —       | 0h                     | Unused address range                                                                                                                                                                      |

- (9) The EEPROM WRITE bit must be sent last. This ensures that the content of all internal registers are stored in the EEPROM. The EEWRITE cycle is initiated with the rising edge of the EEWRITE bit. A static level-high does not trigger an EEPROM WRITE cycle. The EEWRITE bit must be reset to low after the programming is completed. The programming status can be monitored by reading out EEPIP. If EELOCK is set to high, no EEPROM programming is possible.

(1) Writing data beyond 20h may adversely affect device function.

(2) All data is transferred MSB-first.

(3) Unless a custom setting is used

(4) The user can predefine up to eight different control settings. In normal device operation, these settings can be selected by the external control pins, S0, S1, and S2.

## 10 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 10.1 Application Information

The CDCE813-Q1 device is an easy-to-use, high-performance, programmable CMOS clock synthesizer which can be used as a crystal buffer, clock synthesizer with separate output supply pin. The CDCE813-Q1 device features an on-chip loop filter and spread-spectrum modulation. Programming can be done through the I2C interface, or previously saved settings can be loaded from on-chip EEPROM. The pins S0, S1, and S2 can be programmed as control pins to select various output settings. This section shows some examples of using the CDCE813-Q1 device in various applications.

### 10.2 Typical Application

Figure 14 shows the application example of CDCE813-Q1 in combination with an SoC processor and an FPD-Link3 serializer, serving as a PCLK jitter cleaner.

Copyright © 2017, Texas Instruments Incorporated

**Figure 14. PCLK Jitter Cleaner Reference Design**

#### 10.2.1 Design Requirements

The CDCE813-Q1 device supports spread-spectrum clocking (SSC) with multiple control parameters:

- Modulation amount (%)
- Modulation frequency (>20 kHz)
- Center spread or down spread ( $\pm$  or  $-$ )

## Typical Application (continued)

**Figure 15. Modulation Frequency ( $f_m$ ) and Modulation Amount**

## 10.2.2 Detailed Design Procedure

### 10.2.2.1 Spread-Spectrum Clock (SSC)

Spread-spectrum modulation is a method to spread emitted energy over a larger bandwidth. In clocking, spread spectrum can reduce electromagnetic interference (EMI) by reducing the level of emission from clock distribution network.

CDCE502 with a 25-MHz Crystal, FS = 1,  $f_{OUT} = 100$  MHz, and 0%,  $\pm 0.5$ ,  $\pm 1$ %, and  $\pm 2$ % SSC

**Figure 16. Comparison Between Typical Clock Power Spectrum and Spread-Spectrum Clock**

Spread spectrum clocking can be used to help reduce EMI to meet design specifications. For example, a specified EMI threshold of 55 dB/mV would require  $\pm 1$ % spread-spectrum clocking to meet this requirement.

## Typical Application (continued)

### 10.2.2.2 PLL Frequency Planning

At a given input frequency ( $f_{IN}$ ), the output frequency ( $f_{OUT}$ ) of the CDCE813-Q1 device is calculated with Equation 1.

$$f_{OUT} = \frac{f_{IN}}{Pdiv} \times \frac{N}{M}$$

- M (1 to 511) and N (1 to 4095) are the multiplier or divider values of the PLL,
- and Pdiv (1 to 127) is the output divider.

(1)

The target VCO frequency ( $f_{VCO}$ ) of each PLL is calculated with Equation 2.

$$f_{VCO} = f_{IN} \times \frac{N}{M}$$
(2)

The PLL internally operates as fractional divider and needs the following multiplier or divider settings:

- N
- $P = 4 - \text{int}(\log_2 N / M)$ ; if  $P < 0$  then  $P = 0$
- $Q = \text{int}(N' / M)$
- $R = N' - M \times Q$

where

- $\text{int}(X)$  = integer portion of X
- $N' = N \times 2^P$
- $N \geq M$

$$80 \text{ MHz} \leq f_{VCO} \leq 230 \text{ MHz}$$

$$16 \leq Q \leq 63$$

$$0 \leq P \leq 4$$

$$0 \leq R \leq 51$$

#### Example:

for  $f_{IN} = 27 \text{ MHz}$ ;  $M = 1$ ;  $N = 4$ ;  $Pdiv = 2$

- $f_{OUT} = 54 \text{ MHz}$
- $f_{VCO} = 108 \text{ MHz}$
- $P = 4 - \text{int}(\log_2 4) = 4 - 2 = 2$
- $N' = 4 \times 2^2 = 16$
- $Q = \text{int}(16) = 16$
- $R = 16 - 16 = 0$

for  $f_{IN} = 27 \text{ MHz}$ ;  $M = 2$ ;  $N = 11$ ;  $Pdiv = 2$

- $f_{OUT} = 74.25 \text{ MHz}$
- $f_{VCO} = 148.50 \text{ MHz}$
- $P = 4 - \text{int}(\log_2 5.5) = 4 - 2 = 2$
- $N' = 11 \times 2^2 = 44$
- $Q = \text{int}(22) = 22$
- $R = 44 - 44 = 0$

The values for P, Q, R, and N' are automatically calculated when using TI Pro-Clock™ software.

### 10.2.2.3 Crystal Oscillator Start-Up

When the CDCE813-Q1 device can be used as a crystal buffer, the crystal oscillator start-up dominates the start-up time compared to the internal PLL lock time. Figure 17 shows the oscillator start-up sequence for a 27-MHz crystal input with an 8-pF load. The start-up time for the crystal is on the order of approximately 250  $\mu\text{s}$  compared to approximately 10  $\mu\text{s}$  of lock time. In general, lock time is an order of magnitude less compared to the crystal start-up time.

## Typical Application (continued)

**Figure 17. Crystal Oscillator Start-Up vs PLL Lock Time**

### 10.2.2.4 Frequency Adjustment With Crystal Oscillator Pulling

The frequency for the CDCE813-Q1 device is adjusted for media and other applications with the VCXO control input  $V_{ctr}$ . If a PWM-modulated signal is used as a control signal for the VCXO, an external filter is needed.

Copyright © 2017, Texas Instruments Incorporated

**Figure 18. Frequency Adjustment Using PWM Input to the VCXO Control**

### 10.2.2.5 Unused Inputs and Outputs

If VCXO-pulling functionality is not required,  $V_{ctr}$  should be left floating. All other unused inputs should be set to GND. Unused outputs should be left floating.

If one output block is not used, TI recommends disabling it. However, TI recommends providing a supply for all output blocks, even if they are disabled.

### 10.2.2.6 Switching Between XO and VCXO Mode

When the CDCE813-Q1 device is in the crystal-oscillator or VCXO configuration, the internal capacitors require different internal capacitance. The following steps are recommended to switch to VCXO mode when the configuration for the on-chip capacitor is still set for XO mode. To center the output frequency to 0 ppm:

1. While in XO mode, put  $V_{ctr} = V_{DD} / 2$
2. Switch from XO mode to VCXO mode
3. Program the internal capacitors to obtain 0 ppm at the output.

## Typical Application (continued)

### 10.2.3 Application Curves

Figure 19, Figure 20, Figure 21, and Figure 22 show CDCE813-Q1 measurements with the SSC feature enabled. Device configuration: 27-MHz input, 27-MHz output.

## 11 Power Supply Recommendations

There is no restriction on the power-up sequence. In case  $V_{DDOUT}$  is applied first, TI recommends grounding the  $V_{DD}$ . In case  $V_{DDOUT}$  is powered while  $V_{DD}$  is floating, there is a risk of high current flowing on the  $V_{DDOUT}$  pins.

The device has a power-up control that is connected to the 1.8-V supply. This keeps the whole device disabled until the 1.8-V supply reaches a sufficient voltage level. Then the device switches on all internal components, including the outputs. If a 3.3-V  $V_{DDOUT}$  is available before the 1.8-V, the outputs stay disabled until the 1.8-V supply has reached a certain level.

## 12 Layout

### 12.1 Layout Guidelines

When the CDCE813-Q1 device is used as a crystal buffer, any parasitic across the crystal affect the pulling range of the VCXO. Therefore, take care in placing the crystal units on the board. Crystals must be placed as close to the device as possible, ensuring that the routing lines from the crystal terminals to Xin and Xout have the same length.

If possible, cut out both ground plane and power plane under the area where the crystal and the routing to the device are placed. In this area, always avoid routing any other signal line, as it could be a source of noise coupling.

Additional discrete capacitors can be required to meet the load capacitance specification of certain crystals. For example, a 10.7-pF load capacitor is not fully programmable on the chip, because the internal capacitor can range from 0 pF to 20 pF with steps of 1 pF. The 0.7-pF capacitor therefore can be discretely added on top of an internal 10-pF capacitor.

To minimize the inductive influence of the trace, TI recommends placing this small capacitor as close to the device as possible and symmetrically with respect to Xin and Xout.

Figure 23 shows a conceptual layout detailing recommended placement of power-supply bypass capacitors. For component-side mounting, use 0402 body-size capacitors to facilitate signal routing. Keep the connections between the bypass capacitors and the power supply on the device as short as possible. Ground the other side of the capacitor using a low-impedance connection to the ground plane.

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

PW (R-PDSO-G14)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
  - D. Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
  - E. Falls within JEDEC MO-153

PW (R-PDSO-G14)

PLASTIC SMALL OUTLINE

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-7351 is recommended for alternate designs.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
  - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
