

# DAC7614

## Quad, Serial Input, 12-Bit, Voltage Output DIGITAL-TO-ANALOG CONVERTER

### FEATURES

- LOW POWER: 20mW
- UNIPOLAR OR BIPOLAR OPERATION
- SETTLING TIME: 10 $\mu$ s to 0.012%
- 12-BIT LINEARITY AND MONOTONICITY: -40°C to +85°C
- USER SELECTABLE RESET TO MID-SCALE OR ZERO-SCALE
- SECOND-SOURCE for DAC8420
- SMALL 20-LEAD SSOP PACKAGE

### APPLICATIONS

- ATE PIN ELECTRONICS
- PROCESS CONTROL
- CLOSED-LOOP SERVO-CONTROL
- MOTOR CONTROL
- DATA ACQUISITION SYSTEMS

### DESCRIPTION

The DAC7614 is a quad, serial input, 12-bit, voltage output digital-to-analog converter (DAC) with guaranteed 12-bit monotonic performance over the -40°C to +85°C temperature range. An asynchronous reset clears all registers to either mid-scale (800<sub>H</sub>) or zero-scale (000<sub>H</sub>), selectable via the RESETSEL pin. The device can be powered from a single +5V supply or from dual +5V and -5V supplies.

Low power and small size makes the DAC7614 ideal for process control, data acquisition systems, and closed-loop servo-control. The device is available in 16-pin plastic DIP, 16-lead SOIC, or 20-lead SSOP packages, and is guaranteed over the -40°C to +85°C temperature range.

| <b>TEMPERATURE RANGE</b>           |                                                                     |                     |            |                   |                   |     |         |                         |
| Specified Performance              |                                                                     | -40                 |            | +85               | *                 |     | *       | $^{\circ}\text{C}$      |

\* Specification same as grade to the left.

NOTES: (1) If  $V_{SS} = 0\text{V}$ , specification applies at code  $00A_H$  and above. (2) LSB means Least Significant Bit, with  $V_{REFH}$  equal to +2.5V and  $V_{REFL}$  equal to -2.5V, one LSB is 1.22mV. (3) All DAC outputs will match within the specified error band. (4) Ideal output voltage, does not take into account zero or full-scale error. (5) If  $V_{SS} = -5\text{V}$ , full-scale step from code  $000_H$  to  $FFF_H$  or vice-versa. If  $V_{SS} = 0\text{V}$ , full-scale positive step from code  $000_H$  to  $FFF_H$  and negative step from code  $FFF_H$  to  $00A_H$ .

## ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

|                                         |                                |
|-----------------------------------------|--------------------------------|
| $V_{DD}$ to $V_{SS}$ .....              | –0.3V to +11V                  |
| $V_{DD}$ to GND .....                   | –0.3V to +5.5V                 |
| $V_{REFL}$ to $V_{SS}$ .....            | –0.3V to ( $V_{DD} - V_{SS}$ ) |
| $V_{DD}$ to $V_{REFH}$ .....            | –0.3V to ( $V_{DD} - V_{SS}$ ) |
| $V_{REFH}$ to $V_{REFL}$ .....          | –0.3V to ( $V_{DD} - V_{SS}$ ) |
| Digital Input Voltage to GND .....      | –0.3V to $V_{DD} + 0.3V$       |
| Maximum Junction Temperature .....      | +150°C                         |
| Operating Temperature Range .....       | –40°C to +85°C                 |
| Storage Temperature Range .....         | –65°C to +150°C                |
| Lead Temperature (soldering, 10s) ..... | +300°C                         |

NOTE: (1) Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods may affect device reliability.

## ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Burr-Brown recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## PACKAGE/ORDERING INFORMATION

| PRODUCT   | MAXIMUM LINEARITY ERROR (LSB) | MAXIMUM DIFFERENTIAL LINEARITY (LSB) | PACKAGE      | PACKAGE DRAWING NUMBER <sup>(1)</sup> | SPECIFICATION TEMPERATURE RANGE | ORDERING NUMBER <sup>(2)</sup> | TRANSPORT MEDIA |

| "         | "                             | "                                    | "            | "                                     | "                               | DAC7614EB/1K                   | Tape and Reel   |

NOTES: (1) For detailed drawing and dimension table, please see end of data sheet, or Appendix C of Burr-Brown IC Data Book. (2) Models with a slash (/) are available only in Tape and Reel in the quantities indicated (e.g., /1K indicates 1000 devices per reel). Ordering 1000 pieces of "DAC7614EB/1K" will get a single 1000-piece Tape and Reel. For detailed Tape and Reel mechanical information, refer to Appendix B of Burr-Brown IC Data Book.

# THEORY OF OPERATION

The DAC7614 is a quad, serial input, 12-bit, voltage output DAC. The architecture is a classic R-2R ladder configuration followed by an operational amplifier that serves as a buffer. Each DAC has its own R-2R ladder network and output op amp, but all share the reference voltage inputs. The minimum voltage output (“zero-scale”) and maximum voltage output (“full-scale”) are set by external voltage references ( $V_{REFL}$  and  $V_{REFH}$ , respectively). The digital input is a 16-bit serial word that contains the 12-bit DAC code and a 2-bit address code that selects one of the four DACs (the two remaining bits are unused). The converter can be powered from a single +5V supply or a dual  $\pm 5V$  supply. Each device offers a reset function which immediately sets all DAC output voltages and internal registers to either zero-scale (code 000<sub>H</sub>) or mid-scale (code 800<sub>H</sub>). The reset code is selected by the state of the RESETSEL pin (LOW = 000<sub>H</sub>, HIGH = 800<sub>H</sub>). See Figures 1 and 2 for the basic operation of the DAC7614.

# ANALOG OUTPUTS

When  $V_{SS} = -5V$  (dual supply operation), the output amplifier can swing to within 2.25V of the supply rails, over the  $-40^{\circ}C$  to  $+85^{\circ}C$  temperature range. With  $V_{SS} = 0V$  (single-supply operation), the output can swing to ground. Note that the settling time of the output op amp will be longer with voltages very near ground. Also, care must be taken when measuring the zero-scale error when  $V_{SS} = 0V$ . If the output amplifier has a negative offset, the output voltage may not change for the first few digital input codes (000<sub>H</sub>, 001<sub>H</sub>, 002<sub>H</sub>, etc.) since the output voltage cannot swing below ground.

The behavior of the output amplifier can be critical in some applications. Under short-circuit conditions (DAC output shorted to ground), the output amplifier can sink a great deal more current than it can source. See the Specifications table for more details concerning short-circuit current.

FIGURE 1. Basic Single-Supply Operation of the DAC7614.

FIGURE 2. Basic Dual-Supply Operation of the DAC7614.

## REFERENCE INPUTS

The reference inputs,  $V_{REFL}$  and  $V_{REFH}$ , can be any voltage between  $V_{SS} + 2.25V$  and  $V_{DD} - 2.25V$  provided that  $V_{REFH}$  is at least 1.25V greater than  $V_{REFL}$ . The minimum output of each DAC is equal to  $V_{REFL} - 1LSB$  plus a small offset voltage (essentially, the offset of the output op amp). The maximum output is equal to  $V_{REFH}$  plus a similar offset voltage. Note that  $V_{SS}$  (the negative power supply) must either be connected to ground or must be in the range of  $-4.75V$  to  $-5.25V$ . The voltage on  $V_{SS}$  sets several bias points within the converter. If  $V_{SS}$  is not in one of these two configurations, the bias values may be in error and proper operation of the device is not guaranteed.

The current into the reference inputs depends on the DAC output voltages and can vary from a few microamps to approximately 0.6 milliamp. Bypassing the reference voltage or voltages with a  $0.1\mu F$  capacitor placed as close as possible to the DAC7614 package is strongly recommended.

## DIGITAL INTERFACE

Figure 3 and Table I provide the basic timing for the DAC7614. The interface consists of a serial clock (CLK), serial data (SDI), and a load DAC signal ( $\overline{LOADDACS}$ ). In addition, a chip select ( $\overline{CS}$ ) input is available to enable serial communication when there are multiple serial devices. An

| SYMBOL     | DESCRIPTION                              | MIN | TYP | MAX | UNITS   |
|------------|------------------------------------------|-----|-----|-----|---------|

TABLE I. Timing Specifications ( $T_A = -40^\circ C$  to  $+85^\circ C$ ).

asynchronous reset input ( $\overline{RESET}$ ) is provided to simplify start-up conditions, periodic resets, or emergency resets to a known state.

The DAC code and address are provided via a 16-bit serial interface as shown in Figure 3. The first two bits select the DAC register that will be updated when  $\overline{LOADDACS}$  goes LOW (see Table II). The next two bits are not used. The last 12 bits is the DAC code which is provided, most significant bit first.

| L <sup>(4)</sup>                        | L                  | H                             | H                           | No Change             |
| L                                       | ↑ <sup>(5)</sup>   | H                             | H                           | Advanced One Bit      |
| ↑                                       | L                  | H                             | H                           | Advanced One Bit      |
| H <sup>(6)</sup>                        | X                  | L <sup>(7)</sup>              | H                           | No Change             |
| H <sup>(6)</sup>                        | X                  | H                             | L <sup>(8)</sup>            | No Change             |

NOTES: (1) CS $\overline{\text{S}}$  and CLK are interchangeable. (2) H = Logic HIGH. (3) X = Don't Care. (4) L = Logic LOW (5) = Positive Logic Transition. (6) A HIGH value is suggested in order to avoid a "false clock" from advancing the shift register and changing the shift register. (7) If data is clocked into the serial register while LOADDAC $\overline{\text{S}}$  is LOW, the selected DAC register will change as the shift register bits "flow" through A1 and A0. This will corrupt the data in each DAC register that has been erroneously selected. (8) RESET $\overline{\text{S}}$  LOW causes no change in the contents of the serial shift register.

TABLE III. Serial Shift Register Truth Table.

Note that CS $\overline{\text{S}}$  and CLK are combined with an OR gate and the output controls the serial-to-parallel shift register internal to the DAC7614 (see the block diagram on the front of this data sheet). These two inputs are completely interchangeable. In addition, care must be taken with the state of CLK when CS $\overline{\text{S}}$  rises at the end of a serial transfer. If CLK is LOW when CS $\overline{\text{S}}$  rises, the OR gate will provide a rising edge to the shift register, shifting the internal data one additional bit. The result will be incorrect data and possible selection of the wrong DAC.

If both CS $\overline{\text{S}}$  and CLK are used, then CS $\overline{\text{S}}$  should rise only when CLK is HIGH. If not, then either CS $\overline{\text{S}}$  or CLK can be used to operate the shift register. See Table III for more information.

### Digital Input Coding

The DAC7614 input data is in Straight Binary format. The output voltage is given by the following equation:

$$V_{\text{OUT}} = V_{\text{REFL}} + \frac{(V_{\text{REFH}} - V_{\text{REFL}}) \cdot N}{4096}$$

where N is the digital input code (in decimal). This equation does not include the effects of offset (zero-scale) or gain (full-scale) errors.

## LAYOUT

A precision analog component requires careful layout, adequate bypassing, and clean, well-regulated power supplies. As the DAC7614 offers single-supply operation, it will often be used in close proximity with digital logic, microcontrollers, microprocessors, and digital signal processors. The more digital logic present in the design and the higher the switching speed, the more difficult it will be to achieve good performance from the converter.

Because the DAC7614 has a single ground pin, all return currents, including digital and analog return currents, must flow through the GND pin. Ideally, GND would be connected directly to an analog ground plane. This plane would be separate from the ground connection for the digital components until they were connected at the power entry point of the system (see Figure 4).

The power applied to  $V_{DD}$  (as well as  $V_{SS}$ , if not grounded) should be well regulated and low noise. Switching power supplies and DC/DC converters will often have high-frequency glitches or spikes riding on the output voltage. In addition, digital components can create similar high-frequency spikes as their internal logic switches states. This noise can easily couple into the DAC output voltage through various paths between the power connections and analog output.

As with the GND connection,  $V_{DD}$  should be connected to a +5V power supply plane or trace that is separate from the connection for digital logic until they are connected at the power entry point. In addition, the  $1\mu\text{F}$  to  $10\mu\text{F}$  and  $0.1\mu\text{F}$  capacitors shown in Figure 4 are strongly recommended. In some situations, additional bypassing may be required, such as a  $100\mu\text{F}$  electrolytic capacitor or even a “Pi” filter made up of inductors and capacitors—all designed to essentially lowpass filter the +5V supply, removing the high frequency noise (see Figure 4).

FIGURE 4. Suggested Power and Ground Connections for a DAC7614 Sharing a +5V Supply with a Digital System.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION
