

行业标准双路运算放大器

1 特性

- 3V 至 36V 的宽电源电压范围 (B、BA 版本)
- 静态电流 : 300 μ A/通道 (B、BA 版本)
- 单位增益带宽为 1.2 MHz (B、BA 版本)
- 共模输入电压范围包括接地, 支持近地直接感测
- 25°C 时的最大输入失调电压为 2 mV (BA 版本)
- 25°C 时的最大输入失调电压为 3 mV (A、B 版本)
- 内部射频和 EMI 滤波器 (B、BA 版本)
- 对于符合 MIL-PRF-38535 标准的产品, 所有参数均经过测试, 除非另有说明。对于所有其他产品, 生产流程不一定包含对所有参数的测试。

2 应用

- 商用网络和服务器电源单元
- 多功能打印机
- 电源和移动充电器
- 电机控制 : 交流感应、有刷直流、无刷直流、高压、低压、永磁和步进电机
- 台式计算机和主板
- 室内外空调
- 洗衣机、烘干机和冰箱
- 交流逆变器、串式逆变器、中央逆变器和变频器
- 不间断电源
- 电子销售点系统

3 说明

LM358B 和 LM2904B 器件是行业标准运算放大器 LM358 和 LM2904 的下一代版本, 其中包括两个高压 (36V) 运算放大器。这些器件为成本敏感型应用提供了卓越的价值, 其特性包括低偏移 (300 μ V, 典型值)、对地共模输入范围和高差分输入电压能力。

LM358B 和 LM2904B 运算放大器利用单位增益稳定性、更低的失调电压 (最大值为 3mV ; LM358BA 和

LM2904BA 的最大值为 2mV) 和更低的静态电流 (每个放大器为 300 μ A, 典型值) 等增强型特性简化了电路设计。高 ESD (2kV, HBM) 和集成 EMI 以及射频滤波器可支持将 LM358B 和 LM2904B 器件用于更严苛、更具环境挑战性的应用。

LM358B 和 LM2904B 放大器采用微型封装 (如 SOT23-8), 以及行业标准封装 (包括 SOIC、TSSOP 和 VSSOP)。

• 在数据表中添加了器件 LM358B 和 LM2904B.....	1
• 更改了 <i>器件信息</i> 表的前三行，并为状态为预发布的器件添加了交叉参考注释.....	1
• Added a table note to the <i>Pin Functions</i> table	5
• Changed "free-air temperature" to "ambient temperature" in the <i>Absolute Maximum Ratings</i> condition statement.....	6
• Changed all entries in the <i>Absolute Maximum Ratings</i> table except T_J and T_{stg}	6
• Deleted lead temperature and case temperature from <i>Absolute Maximum Ratings</i>	6
• Changed device listings and their voltage values in the <i>ESD Ratings</i> table	6
• Changed "free-air temperature" to "ambient temperature" in the <i>Recommended Operating Conditions</i> condition statement	7
• Changed table entries for all parameters in the <i>Recommended Operating Conditions</i> table.....	7
• Added rows to the Thermal Information table, and a table note regarding device-package combinations	7
• Deleted the <i>Operating Conditions</i> table.....	18
• Added a condition statement to the <i>Typical Characteristics</i> section.....	26
• Changed specific voltages to a <i>Recommended Operating Conditions</i> reference.....	29
• Changed unity-gain bandwidth from 0.7 MHz for all devices to 1.2 MHz for B-version devices.....	30
• Changed slew rate from 3 V/ μ s for all devices to 0.5 V/ μ s for B-version devices.....	30
• Changed the 节 8.3.3 section in multiple places throughout.....	30
• Changed V_{CC} to V_S in the 节 9.1 section	31
• Subscripted the suffixes from R_I and R_F	31
• Changed <i>Operational Amplifier Board Layout for Noninverting Configuration</i> with an image that includes a dual op amp.....	33

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Differential voltages are at $IN+$, with respect to $IN-$.
- (3) Short circuits from outputs to V_S can cause excessive heating and eventual destruction.

6.2 ESD Ratings

		VALUE	UNIT
LM358B, LM358BA, LM2904B, AND LM2904BA			
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1500	
LM158, LM258, LM358, LM158A, LM258A, LM358A, LM2904, AND LM2904V			
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±500	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8 Detailed Description

8.1 Overview

These devices consist of two independent, high-gain frequency-compensated operational amplifiers designed to operate from a single supply over a wide range of voltages. Operation from split supplies also is possible if the difference between the two supplies is within the supply voltage range specified in 节 6.3 and V_S is at least 1.5 V more positive than the input common-mode voltage. The low supply-current drain is independent of the magnitude of the supply voltage.

Applications include transducer amplifiers, dc amplification blocks, and all the conventional operational amplifier circuits that now can be implemented more easily in single-supply-voltage systems. For example, these devices can be operated directly from the standard 5-V supply used in digital systems and easily can provide the required interface electronics without additional ± 5 -V supplies.

8.2 Functional Block Diagram: LM358B, LM358BA, LM2904B, LM2904BA

8.3 Feature Description

8.3.1 Unity-Gain Bandwidth

The unity-gain bandwidth is the frequency up to which an amplifier with a unity gain may be operated without greatly distorting the signal. These devices have a 1.2-MHz unity-gain bandwidth (B Version).

8.3.2 Slew Rate

The slew rate is the rate at which an operational amplifier can change its output when there is a change on the input. These devices have a 0.5-V/ μ s slew rate (B Version).

8.3.3 Input Common Mode Range

The valid common mode range is from device ground to $V_S - 1.5\text{ V}$ ($V_S - 2\text{ V}$ across temperature). Inputs may exceed V_S up to the maximum V_S without device damage. At least one input must be in the valid input common-mode range for the output to be the correct phase. If both inputs exceed the valid range, then the output phase is undefined. If either input more than 0.3 V below V_- then input current should be limited to 1 mA and the output phase is undefined.

8.4 Device Functional Modes

These devices are powered on when the supply is connected. This device can be operated as a single-supply operational amplifier or dual-supply amplifier, depending on the application.

9 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The LMx58 and LM2904 operational amplifiers are useful in a wide range of signal conditioning applications. Inputs can be powered before V_S for flexibility in multiple supply circuits.

9.2 Typical Application

A typical application for an operational amplifier is an inverting amplifier. This amplifier takes a positive voltage on the input, and makes it a negative voltage of the same magnitude. In the same manner, it also makes negative voltages positive.

图 9-1. Application Schematic

9.2.1 Design Requirements

The supply voltage must be chosen such that it is larger than the input voltage range and output range. For instance, this application scales a signal of ± 0.5 V to ± 1.8 V. Setting the supply at ± 12 V is sufficient to accommodate this application.

9.2.2 Detailed Design Procedure

Determine the gain required by the inverting amplifier using [方程式 1](#) and [方程式 2](#):

$$A_V = \frac{V_{OUT}}{V_{IN}} \quad (1)$$

$$A_V = \frac{1.8}{-0.5} = -3.6 \quad (2)$$

Once the desired gain is determined, choose a value for R_I or R_F . [Subscripts should be fixed in the accompanying figures and equations also.] Choosing a value in the kilohm range is desirable because the amplifier circuit uses currents in the milliamperage range. This ensures the part does not draw too much current. This example uses $10 \text{ k}\Omega$ for R_I which means $36 \text{ k}\Omega$ is used for R_F . This was determined by [方程式 3](#).

$$A_V = -\frac{R_F}{R_I} \quad (3)$$

10 Power Supply Recommendations

CAUTION

Supply voltages larger than specified in the recommended operating region can permanently damage the device (see 节 6.1).

Place 0.1- μ F bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or high-impedance power supplies. For more detailed information on bypass capacitor placement, see 节 11.

11 Layout

11.1 Layout Guidelines

For best operational performance of the device, use good PCB layout practices, including:

- Noise can propagate into analog circuitry through the power pins of the circuit as a whole, as well as the operational amplifier. Bypass capacitors are used to reduce the coupled noise by providing low-impedance power sources local to the analog circuitry.
 - Connect low-ESR, 0.1- μ F ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from V+ to ground is applicable for single-supply applications.
- Separate grounding for analog and digital portions of circuitry is one of the simplest and most-effective methods of noise suppression. One or more layers on multilayer PCBs are usually devoted to ground planes. A ground plane helps distribute heat and reduces EMI noise pickup. Make sure to physically separate digital and analog grounds, paying attention to the flow of the ground current.
- To reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If it is not possible to keep them separate, it is much better to cross the sensitive trace perpendicular as opposed to in parallel with the noisy trace.
- Place the external components as close to the device as possible. Keeping R_F and R_G close to the inverting input minimizes parasitic capacitance, as shown in 节 11.2.
- Keep the length of input traces as short as possible. Always remember that the input traces are the most sensitive part of the circuit.
- Consider a driven, low-impedance guard ring around the critical traces. A guard ring can significantly reduce leakage currents from nearby traces that are at different potentials.

12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. PACKAGE OUTLINE

SOT-23 - 1.1 mm max height

PLASTIC SMALL OUTLINE

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.

NOTES:

- Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
- This drawing is subject to change without notice.
- This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed $.006$ [0.15] per side.
- This dimension does not include interlead flash.
- Reference JEDEC registration MS-012, variation AA.
