11.3 Gbps Limiting Transimpedance Amplifier With RSSI

Check for Samples: ONET8501T

FEATURES

- **10 GHz Bandwidth**
- **7 kΩ Differential Small Signal Transimpedance**
- **2.5 mA_{PP} Input Overload Current**
- **Received Signal Strength Indication (RSSI)**
- **100mW Typical Power Dissipation**
- **CML Data Outputs With On-Chip 50Ω Back-Termination**
- **On Chip Supply Filter Capacitor**
- **Single 3.3V Supply**
- **Die Size: 940 × 1195 µm**

APPLICATIONS

- **SONET OC-192**
- **SFP+ Optical Receivers**
- **10x Fibre Channel Optical Receivers**
- **10G Ethernet Receivers**
- **PIN Preamplifier-Receivers**
- **APD Preamplifier Receivers**

DESCRIPTION

The ONET8501T is a high-speed, high gain, limiting transimpedance amplifier used in optical receivers with data rates up to 12.5Gbps. It features low input referred noise, 10GHz bandwidth, 7kΩ small signal transimpedance, and a received signal strength indicator (RSSI).

The ONET8501T is available in die form, includes an on-chip V_{CC} bypass capacitor and is optimized for packaging in a TO can.

The ONET8501T requires a single 3.3V ±10% supply and its power efficient design typically dissipates less than 105mW. The device is characterized for operation from –40°C to 100°C case (IC back side) temperature.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

BLOCK DIAGRAM

A simplified block diagram of the ONET8501T is shown in Figure 1.

The ONET8501T consists of the signal path, supply filters, a control block for dc input bias, automatic gain control (AGC) and received signal strength indication (RSSI). The RSSI provides the bias for the TIA stage and the control for the AGC.

The signal path consists of a transimpedance amplifier stage, a voltage amplifier, and a CML output buffer. The on-chip filter circuit provides a filtered V_{CC} for the PIN photodiode and for the transimpedance amplifier.

The DC input bias circuit and automatic gain control use internal low pass filters to cancel the dc current on the input and to adjust the transimpedance amplifier gain. Furthermore, circuitry to monitor the received signal strength is provided.

BOND PAD ASSIGNMENT

The ONET8501T is available in die form. The locations of the bondpads are shown in Figure 2.

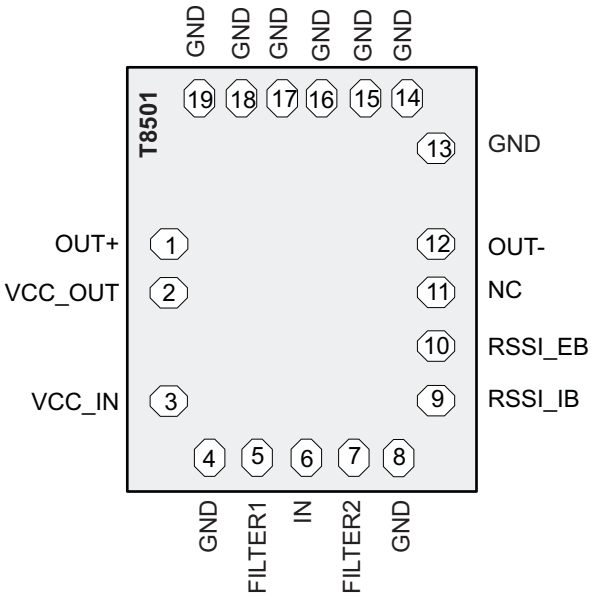

Figure 2. Bond Pad Assignment of ONET8501T

PIN FUNCTIONS

PIN		TYPE	DESCRIPTION
NAME	NO.		
GND	4, 8, 13–19	Supply	Circuit ground. All GND pads are connected on die. Bonding all pads is optional; however, for optimum performance a good ground connection is mandatory.
OUT+	1	Analog output	Non-inverted CML data output. On-chip 50Ω back-terminated to V_{CC}.
VCC_OUT	2	Supply	2.97V–3.63V supply voltage for the voltage and CML amplifiers.
VCC_IN	3	Supply	2.97V–3.63V supply voltage for input TIA stage.
FILTER	5, 7	Analog	Bias voltage for photodiode cathode. These pads are internally connected to an 220Ω resistor to V_{CC} and a filter capacitor to ground (GND).
IN	6	Analog input	Data input to TIA (photodiode anode).
RSSI_EB	10	Analog output	Optional use when operated with external PD bias (e.g. APD). Analog output current proportional to the input data amplitude. Indicates the strength of the received signal (RSSI).Connected to an external resistor to ground (GND). For proper operation, ensure that the voltage at the RSSI pad does not exceed V_{CC} – 0.65V. If the RSSI feature is not used this pad should be left open.
RSSI_IB	9	Analog output	Analog output current proportional to the input data amplitude. Indicates the strength of the received signal (RSSI) if the photo diode is biased from the TIA. Connected to an external resistor to ground (GND). For proper operation, ensure that the voltage at the RSSI pad does not exceed V_{CC} – 0.65V. If the RSSI feature is not used this pad should be left open.
OUT–	12	Analog output	Inverted CML data output. On-chip 50Ω back-terminated to V_{CC}.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)(1)

		VALUE	UNIT
V_I	Supply voltage(2) at VCC_IN, VCC_OUT	–0.3 to 4.0	V
	Voltage at FILTER1, FILTER2, OUT+, OUT–, RSSI_IB, RSSI_EB(2)	–0.3 to 4.0	V
I_I	Current into IN	–0.7 to 3.5	mA
	Current into FILTER1, FILTER2	–8 to 8	mA
I_O	Continuous current at outputs at OUT+, OUT-	–8 to 8	mA
ESD	ESD rating at all pins except input IN, RSSI_IB, and RSSI_EB	2	kV (HBM)
	ESD rating at RSSI_IB and RSSI_EB	1	kV(HBM)
	ESD rating at input IN	0.5	kV(HBM)
T_J	Maximum junction temperature	125	°C

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to network ground terminal.

RECOMMENDED OPERATING CONDITIONS

PARAMETER		CONDITIONS	MIN	TYP	MAX	UNIT
V_{CC}	Supply voltage		2.97	3.3	3.63	V
T_A	Operating backside die temperature		–40		100(1)	°C
L	Wire-bond inductor at pins FILTER and IN			0.3	0.5	nH
C_{PD}	Photodiode Capacitance			0.2		pF

(1) 105°C maximum junction temperature

DC ELECTRICAL CHARACTERISTICS

over recommended operating conditions (unless otherwise noted). Typical values are at V_{CC} = 3.3 V and T_A = 25°C

PARAMETER		CONDITIONS	MIN	TYP	MAX	UNIT
V_{CC}	Supply voltage		2.97	3.3	3.63	V
I_{CC}	Supply current	Input current I_{IN} < 1500 μA_{PP}	21	28	41(1)	mA
		Input current I_{IN} < 2500 μA_{PP}			44(1)	
V_{IN}	Input bias voltage		0.75	0.85	0.98	V
$R_{(OUT)}$	Output resistance	Single-ended to V_{CC}	40	50	60	Ω
$R_{(FILTER)}$	Photodiode filter resistance			220		Ω

(1) Including RSSI current

AC ELECTRICAL CHARACTERISTICS

over recommended operating conditions (unless otherwise noted). Typical values are at V_{CC} = +3.3 V and T_A = 25°C

PARAMETER		CONDITIONS	MIN	TYP	MAX	UNIT
Z	Small signal transimpedance	Differential output; Input current I_{IN} = 20 μA_{PP}	5,000	7,000	10,000	Ω
$f_{(HSS,3dB)}$	Small signal bandwidth	i_{IN} = 16 μA_{PP} (1)	7	10		GHz
$f_{(L,3dB)}$	Low frequency –3 dB bandwidth	16 µA < I_{IN} < 2000 μA_{PP}		30	100	kHz
$i_{(N,IN)}$	Input referred RMS noise	10 GHz bandwidth(2)		0.9	1.6	µA
$S_{(US)}$	Unstressed sensitivity	10.3125 Gbps, PRBS31 pattern, 850 nm, BER 10^{-12}		–14		dBm
D_J	Deterministic jitter	16 μA_{PP} < I_{IN} < 500 μA_{PP} (10.3125 Gbps, PRBS31 pattern)		6	11	ps_{PP}
		500 μA_{PP} < I_{IN} < 2000 μA_{PP} (10.3125 Gbps, PRBS31 pattern)		6	13	
$D_{J(OL)}$	Overload deterministic jitter	2000 μA_{PP} < I_{IN} < 2500 μA_{PP} (K28.5 pattern)		6	15	ps_{PP}
$V_{OUT,D,MAX}$	Maximum differential output voltage	Input current I_{IN} = 200 μA_{PP}	240	280	350	mV_{PP}
A_{RSSI_IB}	RSSI gain internal bias	Resistive load to GND(3)	0.48	0.5	0.52	A/A
	RSSI internal bias output offset current (no light)(4)		3.5	10	16	µA
A_{RSSI_EB}	RSSI gain external bias	Resistive load to GND(3)	0.43		0.6	A/A
	RSSI external bias output offset current (no light)			25		µA
PSNR	Power supply noise rejection	F < 10 MHz(5), supply filtering according to SFF8431		–15		dB

(1) The small signal bandwidth is specified over process corners, temperature, and supply voltage variation. The assumed photodiode capacitance is 0.2 pF and the bond-wire inductance is 0.3 nH. The small signal bandwidth strongly depends on environmental parasitics. Careful attention to layout parasitics and external components is necessary to achieve optimal performance.
(2) Input referred RMS noise is (RMS output noise)/ (gain at 100 MHz).
(3) The RSSI output is a current output, which requires a resistive load to ground (GND). The voltage gain can be adjusted for the intended application by choosing the external resistor; however, for proper operation, ensure that the voltage at RSSI does not exceed V_{CC} – 0.65V.
(4) Offset is added to improve accuracy below 5µA. When measured without input current (no light) the offset can be subtracted as a constant offset from RSSI measurements.
(5) PSNR is the differential output amplitude divided by the voltage ripple on supply; no input current at IN.

DETAILED DESCRIPTION

SIGNAL PATH

The first stage of the signal path is a transimpedance amplifier which converts the photodiode current into a voltage. If the input signal current exceeds a certain value, the transimpedance gain is reduced by means of a nonlinear AGC circuit to limit the signal amplitude.

The second stage is a limiting voltage amplifier that provides additional limiting gain and converts the single ended input voltage into a differential data signal. The output stage provides CML outputs with an on-chip 50Ω back-termination to V_{CC}.

FILTER CIRCUITRY

The FILTER pins provide a filtered V_{CC} for a PIN photodiode bias. The on-chip low pass filter for the photodiode is implemented using a filter resistor of 220Ω and a capacitor. The corresponding corner frequency is below 5MHz. The supply voltages for the transimpedance amplifier are filtered by means of on-chip capacitors, thus avoiding the necessity to use an external supply filter capacitor. The input stage has a separate V_{CC} supply (VCC_IN) which is not connected on chip to the supply of the limiting and CML stages (VCC_OUT).

AGC AND RSSI

The voltage drop across the internal photodiode supply-filter resistor is monitored by the bias and RSSI control circuit block in the case where a PIN diode is biased using the FILTER pins.

If the dc input current exceeds a certain level then it is partially cancelled by means of a controlled current source. This keeps the transimpedance amplifier stage within sufficient operating limits for optimum performance.

The automatic gain control circuitry adjusts the voltage gain of the AGC amplifier to ensure limiting behavior of the complete amplifier.

Finally this circuit block senses the current through the filter resistor and generates a mirrored current that is proportional to the input signal strength. The mirrored current is available at the RSSI_IB output and can be sunk to ground (GND) using an external resistor. For proper operation, ensure that the voltage at the RSSI_IB pad does not exceed V_{CC} – 0.65V.

If an APD or PIN photodiode is used with an external bias then the RSSI_EB pin should be used. However, for greater accuracy under external photo diode biasing conditions, it is recommended to derive the RSSI from the external bias circuitry.

APPLICATION INFORMATION

Figure 15 shows the ONET8501T used in a typical fiber optic receiver using the internal photodiode bias. The ONET8501T converts the electrical current generated by the PIN photodiode into a differential output voltage. The FILTER inputs provide a dc bias voltage for the PIN that is low pass filtered by the combination of an internal 220Ω resistor and a capacitor. Because the voltage drop across the 220Ω resistor is sensed and used by the bias circuit, the photodiode must be connected to the FILTER pads for the bias to function correctly.

The RSSI output is used to mirror the photodiode output current and can be connected via a resistor to GND. The voltage gain can be adjusted for the intended application by choosing the external resistor; however, for proper operation of the ONET8501T, ensure that the voltage at RSSI never exceeds V_{CC} – 0.65V. If the RSSI output is not used while operating with internal PD bias, it should be left open.

The OUT+ and OUT– pins are internally terminated by 50Ω pull-up resisters to V_{CC}. The outputs must be ac coupled, for example by using 0.1µF capacitors, to the succeeding device.

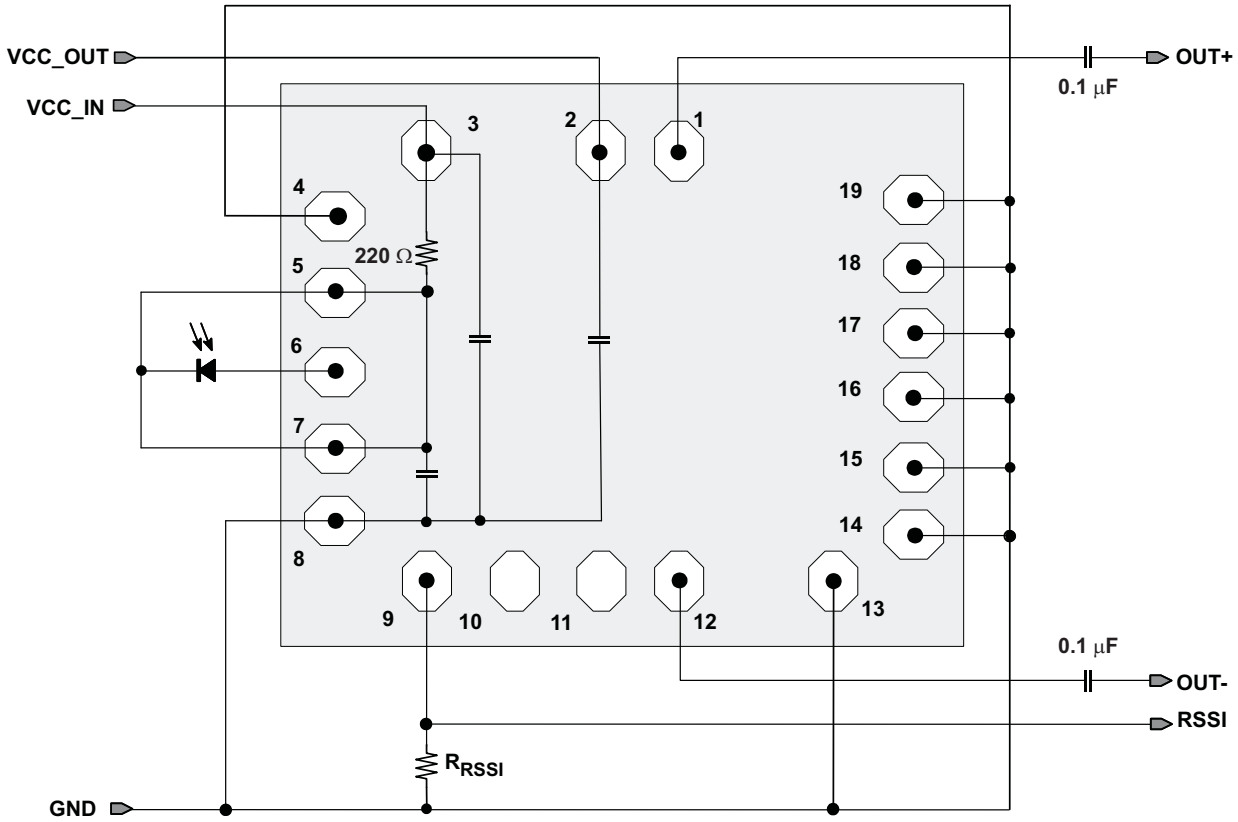

Figure 15. Basic Application Circuit for PIN Receivers

Copyright © 2008–2011, Texas Instruments Incorporated

Figure 16 shows the ONET8501T being used in a typical fiber optic receiver using an external photodiode bias for an APD photodiode. This configuration can also be used for a PIN diode if desired. The external bias RSSI signal is based on a dc offset value and is not as accurate as the internal bias RSSI signal which is based upon the photodiode current.

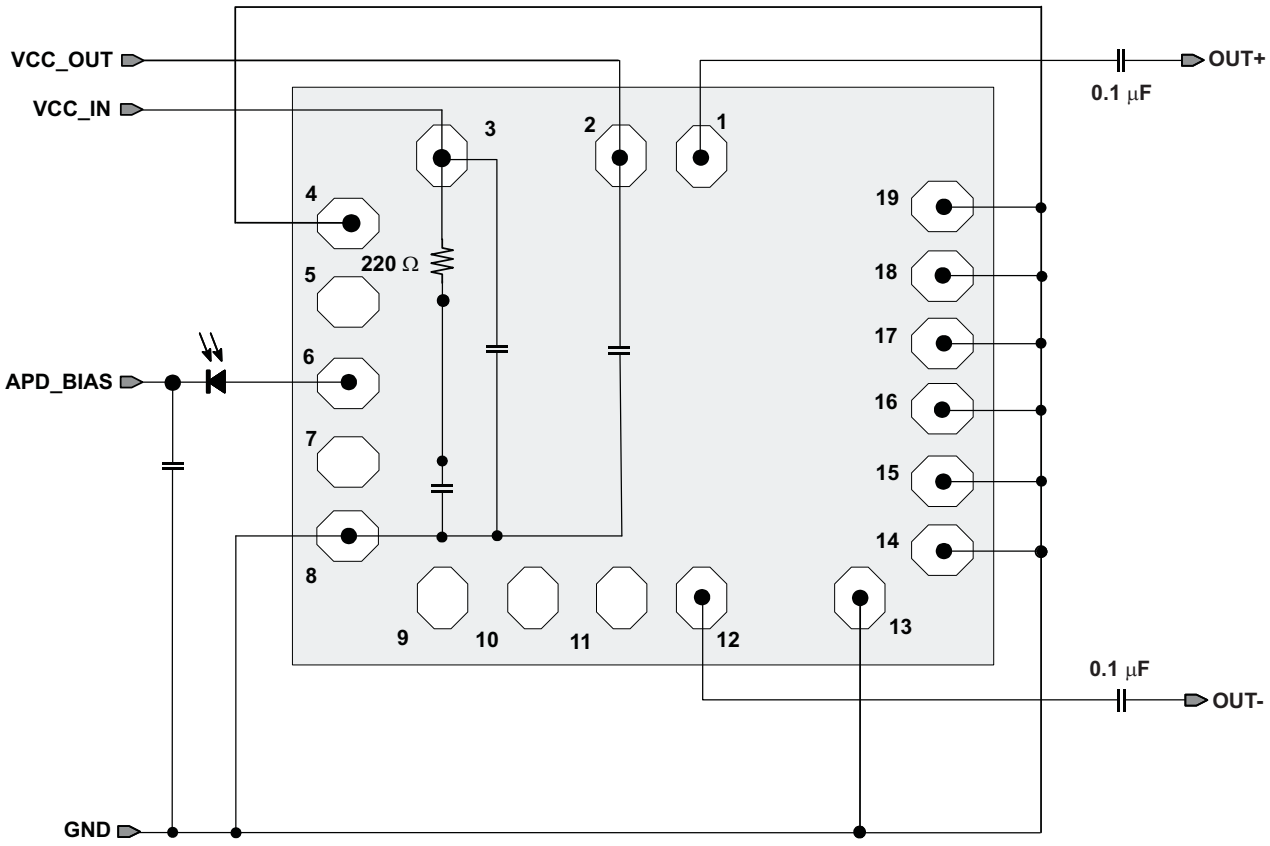

Figure 16. Basic Application Circuit for APD Receivers

ASSEMBLY RECOMMENDATIONS

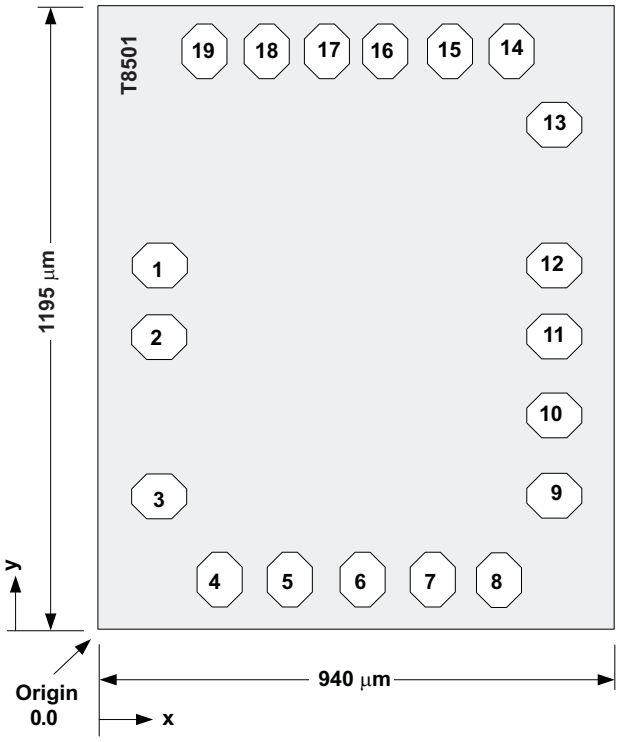

Careful attention to assembly parasitics and external components is necessary to achieve optimal performance.

Recommendations that optimize performance include:

1. Minimize the total capacitance on the IN pad by using a low capacitance photodiode and paying attention to stray capacitances. Place the photodiode close to the ONET8501T die in order to minimize the bond wire length and thus the parasitic inductance.
2. Use identical termination and symmetrical transmission lines at the ac coupled differential output pins OUT+ and OUT–.
3. Use short bond wire connections for the supply terminals VCC_IN, VCC_OUT and GND. Supply voltage filtering is provided on chip but filtering may be improved by using an additional external capacitor.

REVISION HISTORY

Changes from Original (February 2008) to Revision A **Page**

- Changed Features bullet From: Die Size 945 x 1200 µm To: Die Size: 940 × 1195 µm 1
- Changed the CHIP DIMENSIONS AND PAD LOCATIONS image. Y = 1200 µm To: 1195 µm and X = 945 µm To: 940 µm 12
- Added Die Thickness, Pad Dimensions, and Die Size 12

Changes from Revision A (January 2010) to Revision B **Page**

- Changed From: Die Size: 940 ± 20 µm × 1195 ± 20 µm To: Die Size: 940 ± 40 µm × 1195 ± 40 µm 12
- Changed the Coordinates column to include " (based on typical die size)" 12

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ONET8501TY	ACTIVE	DIESALE	Y	0	1800	TBD	Call TI	Call TI	-40 to 100		Samples
ONET8501TYS	ACTIVE	DIESALE	Y	0	1	TBD	Call TI	Call TI	-40 to 100		Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
