

TLV5613

2.7 V TO 5.5 V 12-BIT PARALLEL DIGITAL-TO-ANALOG CONVERTER WITH POWER DOWN

SLAS174B – DECEMBER 1997 – REVISED NOVEMBER 2000

- 12-Bit Voltage Output DAC
- Single Supply 2.7-V to 5.5-V Operation
- Separate Analog and Digital Supplies
- ± 0.4 LSB Differential Nonlinearity (DNL), ± 1.5 LSB Integral Nonlinearity (INL)
- Programmable Settling Time vs Power Consumption:
1 μ s/4.2 mW in Fast Mode,
3.5 μ s/1.2 mW in Slow Mode
- 8-Bit μ Controller Compatible Interface (8+4 Bit)
- Power-Down Mode (50 nW)
- Rail-to-Rail Output Buffer
- Synchronous or Asynchronous Update
- Monotonic Over Temperature

applications

- Digital Servo Control Loops
- Battery Powered Test Instruments
- Digital Offset and Gain Adjustment
- Industrial Process Control
- Speech Synthesis
- Machine and Motion Control Devices
- Mass Storage Devices

description

The TLV5613 is a 12-bit voltage output digital-to-analog converter (DAC) with a 8-bit microcontroller compatible parallel interface. The 8 LSBs, the 4 MSBs and 3 control bits are written using three different addresses. Developed for a wide range of supply voltages, the TLV5613 can be operated from 2.7 V to 5.5 V.

The resistor string output voltage is buffered by a x2 gain rail-to-rail output buffer. The buffer features a Class A (slow mode: AB) output stage to improve stability and reduce settling time. The programmable settling time of the DAC allows the designer to optimize speed versus power dissipation. The settling time can be chosen by the control bits within the 16-bit data word.

Implemented with a CMOS process, the device is designed for single supply operation from 2.7 V to 5.5 V. It is available in 20 pin SOIC in standard commercial and industrial temperature ranges.

		Full scale, See Note 3		–65				

NOTES: 2. Power supply rejection ratio at zero scale is measured by varying AV_{DD} and is given by:

$$PSRR = 20 \log [(E_{ZS}(AV_{DDmax}) - E_{ZS}(AV_{DDmin})) / AV_{DDmax}]$$

3. Power supply rejection ratio at full scale is measured by varying AV_{DD} and is given by:

$$PSRR = 20 \log [(E_G(AV_{DDmax}) - E_G(AV_{DDmin})) / AV_{DDmax}]$$

static DAC specifications

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
Resolution		V _{ref} (REFIN) = 2.048 V, 1.024 V		12			bits
Integral nonlinearity (INL), end point adjusted		V _{ref} (REFIN) = 2.048 V, 1.024 V,	See Note 4		±1.5	±4	LSB
Differential nonlinearity (DNL)		V _{ref} (REFIN) = 2.048 V, 1.024 V,	See Note 5		±0.4	±1	LSB
E _{ZS}	Zero-scale error (offset error at zero scale)	V _{ref} (REFIN) = 2.048 V, 1.024 V,	See Note 6		±3	±20	mV
Zero-scale-error temperature coefficient		V _{ref} (REFIN) = 2.048 V, 1.024 V,	See Note 7		3		ppm/°C
E _G	Gain error	V _{ref} (REFIN) = 2.048 V, 1.024 V,	See Note 8		±0.25	±0.5	% of FS voltage
Gain error temperature coefficient		V _{ref} (REFIN) = 2.048 V, 1.024 V,	See Note 9		1		ppm/°C

NOTES: 4. The relative accuracy or integral nonlinearity (INL) sometimes referred to as linearity error, is the maximum deviation of the output from the line between zero and full scale excluding the effects of zero code and full-scale errors.

5. The differential nonlinearity (DNL) sometimes referred to as differential error, is the difference between the measured and ideal 1 LSB amplitude change of any two adjacent codes. Monotonic means the output voltage changes in the same direction (or remains constant) as a change in the digital input code.

6. Zero-scale error is the deviation from zero voltage output when the digital input code is zero.

7. Zero-scale-error temperature coefficient is given by: $E_{ZS} TC = [E_{ZS}(T_{max}) - E_{ZS}(T_{min})] / V_{ref} \times 10^6 / (T_{max} - T_{min})$.

8. Gain error is the deviation from the ideal output (V_{ref} – 1 LSB) with an output load of 10 kΩ excluding the effects of the zero-error.

9. Gain temperature coefficient is given by: $E_G TC = [E_G(T_{max}) - E_G(T_{min})] / V_{ref} \times 10^6 / (T_{max} - T_{min})$.

TYPICAL CHARACTERISTICS

Figure 14

APPLICATION INFORMATION

general function

The TLV5613 is a 12-bit, single supply DAC, based on a resistor string architecture. It consists of a parallel interface, speed and power down control logic, a resistor string and a rail-to-rail output buffer. The output voltage (full scale determined by reference) is given by:

$$2 \text{ REF } \frac{\text{CODE}}{0x1000} \text{ [V]}$$

Where REF is the reference voltage and CODE is the digital input value, range 0x000 to 0xFFFF. A power on reset initially puts the internal latches to a defined state (all bits zero).

parallel interface

The device latches data on the positive edge of $\overline{WE}$. It must be enabled with $\overline{CS}$ low. Whether the data is written to one of the DAC holding latches (MSW, LSW) or the control register, depends on the address bits A1 and A0. $\overline{LDAC}$ low updates the DAC with the value in the holding latch. $\overline{LDAC}$ is an asynchronous input and can be held low, if a separate update is not necessary. Two more asynchronous inputs, SPD and $\overline{PWD}$ control the settling times and the power down mode:

SPD:	Speed control	1 → fast mode	0 → slow mode
$\overline{PWD}$:	Power control	1 → normal operation	0 → power down

2.7 V TO 5.5 V 12-BIT PARALLEL DIGITAL-TO-ANALOG CONVERTER WITH POWER DOWN

SLAS174B – DECEMBER 1997 – REVISED NOVEMBER 2000

APPLICATION INFORMATION

It is also possible to program the different modes (fast, slow, power down) and the DAC update latch using the control register. The following tables list the possible combination of the control signals and control bits.

PIN	BIT	MODE
SPD	SPD	
0	0	Slow
0	1	Fast
1	0	Fast
1	1	Fast

PIN	BIT	POWER
$\overline{\text{PWD}}$	PWD	
0	0	Down
0	1	Down
1	0	Normal
1	1	Down

PIN	BIT	LATCH
$\overline{\text{LDAC}}$	RLDAC	
0	0	Transparent
0	1	Transparent
1	0	Hold
1	1	Transparent

data format

The TLV5613 writes data either to one of the DAC holding latches or to the control register depending on the address bits A1 and A0.

ADDRESS BITS

A1	A0	REGISTER
0	0	DAC LSW holding
0	1	DAC MSW holding
1	0	Reserved
1	1	Control

D7	D6	D5	D4	D3	D2	D1	D0
X	X	X	X	X	RLDAC	PWD	SPD

X: Don't care

SPD: Speed control bit

1 → fast mode

0 → slow mode

PWD: Power control bit

1 → power down

0 → normal operation

RLDAC: Load DAC latch

1 → latch transparent

0 → DAC latch controlled by $\overline{\text{LDAC}}$ pin

SLAS174B – DECEMBER 1997 – REVISED NOVEMBER 2000

APPLICATION INFORMATION

layout considerations

To achieve the best performance, it is recommended to have separate power planes for GND, AV_{DD} , and DV_{DD} . Figure 15 shows how to lay out the power planes for the TLV5613. As a general rule, digital and analog signals should be separated as wide as possible. To avoid crosstalk, analog and digital traces must not be routed in parallel. The two positive power planes (AV_{DD} and DV_{DD}) should be connected together at one point with a ferrite bead.

A 100-nF ceramic low series inductance capacitor between DV_{DD} and GND and a 1- μ F tantalum capacitor between AV_{DD} and GND as close as possible to the supply pins are recommended for optimal performance.

Figure 15. TLV5613 Board Layout

linearity, offset, and gain error using single end supplies

When an amplifier is operated from a single supply, the voltage offset can still be either positive or negative. With a positive offset, the output voltage changes on the first code change. With a negative offset the output voltage may not change with the first code depending on the magnitude of the offset voltage.

The output amplifier attempts to drive the output to a negative voltage. However, because the most negative supply rail is ground, the output cannot drive below ground and clamps the output at 0 V.

The output voltage remains at zero until the input code value produces a sufficient positive output voltage to overcome the negative offset voltage, resulting in the transfer function shown in Figure 16.

Figure 16. Effect of Negative Offset (Single Supply)

APPLICATION INFORMATION

This offset error, not the linearity error, produces this breakpoint. The transfer function would have followed the dotted line if the output buffer could drive below the ground rail.

For a DAC, linearity is measured between zero input code (all inputs 0) and full scale code (all inputs 1) after offset and full scale are adjusted out or accounted for in some way. However, single supply operation does not allow for adjustment when the offset is negative due to the breakpoint in the transfer function. So the linearity is measured between full scale code and the lowest code that produces a positive output voltage.

TLV5613 interfaced to an Intel MCS[®]251 controller

The circuit in Figure 17 shows how to interface the TLV5613 to an Intel MCS[®]251 microcontroller. The address bus and the data bus of the controller are multiplexed on port 0 (non page mode) to save port pins. To separate the address bits and the data bits, the controller provides a dedicated signal, address latch enable (ALE), which is connected to a latch at port 0.

An address decoder is required to generate the chip select signal for the TLV5613. In this example, a simple 3-to-8 decoder (74AC138) is used for the interface as shown in Figure 17. The DAC is memory mapped at addresses 0x8000/1/2/3 within the data memory address space and mirrored every 32 address locations (0x8020/1/2/3, 0x8040/1/2/3, etc.). In a typical microcontroller system, programmable logic should be used to generate the chip select signals for the entire system.

The data pins and the $\overline{WE}$ pin of the TLV5613 can be connected directly to the multiplexed address and data bus and the $\overline{WR}$ signal of the controller.

$\overline{LDAC}$ is held high so that the output voltage is updated using the RLDAC bit in the control register. Hardware power down mode is deactivated permanently by pulling $\overline{PWD}$ to DV_{DD} .

Figure 17. TLV5613 Interfaced to an Intel MCS[®]251 Controller

TLV5613

2.7 V TO 5.5 V 12-BIT PARALLEL DIGITAL-TO-ANALOG CONVERTER WITH POWER DOWN

SLAS174B – DECEMBER 1997 – REVISED NOVEMBER 2000

APPLICATION INFORMATION

software

In the following example, the code generates a waveform at 500 KSPS with 500 samples stored in a table within the program memory space of the microcontroller. The period of the waveform is 1 ms.

The waveform data is located in the program memory space from address 01000h to address 013E8h ($2 \times 500 = 1000 = 03E8h$) beginning with the MSW of the first 16-bit word (the 4 MSBs are ignored), followed by the LSW. Two bytes are required for each DAC word (the table is not shown in the code example).

The program consists of two parts:

- A main routine, which is executed after reset and which initializes the timer and the interrupt system of the microcontroller.
- An interrupt service routine, which reads a new value from the waveform table and writes it to the DAC.

This example uses timer 0 in mode 3 (8-bit timer with auto reload). The clock of the timer is derived from the system clock and has a frequency of $f_{OSC}/12$. The timer overrun frequency f_{tim} is given by the following equation:

$$f_{tim} = \frac{f_{OSC}}{12(256 - \text{Reload})} \text{ and the reload value is given by } \text{Reload} = 256 - \frac{f_{OSC}}{12 f_{tim}}$$

To get a timer overrun frequency of 500 kHz at a system clock of 24 MHz, the reload value is:

$$\text{Reload} = 256 - \frac{24}{12 \times 0.5} = 256 - 4 = 252 = 0FCh$$

With this value, the timer generates an interrupt every 2 μ s. The corresponding service routine T0_isr reads a sample from program memory and writes it to the DAC. First, it disables the update of the DAC output by clearing the RLDAC bit in the control register. Then it reads the MSW and the LSW from the waveform table and stores it in the MSW and LSW register of the TLV5613. The write cycle is completed by setting the RLDAC bit, which updates the DAC output. At the end of the interrupt service routine, the pointer to the waveform samples is increased and is checked to determine if it has reached the end of the table. If the pointer has reached the end of the table, the pointer is set to the start address of the table.

APPLICATION INFORMATION**definitions of specifications and terminology****integral nonlinearity (INL)**

The relative accuracy or integral nonlinearity (INL), sometimes referred to as linearity error, is the maximum deviation of the output from the line between zero and full scale excluding the effects of zero code and full-scale errors.

differential nonlinearity (DNL)

The differential nonlinearity (DNL), sometimes referred to as differential error, is the difference between the measured and ideal 1 LSB amplitude change of any two adjacent codes. Monotonic means the output voltage changes in the same direction (or remains constant) as a change in the digital input code.

zero-scale error (E_{ZS})

Zero-scale error is defined as the deviation of the output from 0 V at a digital input value of 0.

gain error (E_G)

Gain error is the error in slope of the DAC transfer function.

signal-to-noise ratio + distortion (SINAD)

Signal-to-noise ratio + distortion is the ratio of the rms value of the output signal to the rms sum of all other spectral components below the Nyquist frequency, including harmonics but excluding dc. The value for SINAD is expressed in decibels.

spurious free dynamic range (SFDR)

Spurious free dynamic range is the difference between the rms value of the output signal and the rms value of the spurious signal within a specified bandwidth. The value for SFDR is expressed in decibels.

total harmonic distortion (THD)

Total harmonic distortion is the ratio of the rms sum of the first six harmonic components to the rms value of the fundamental signal and is expressed in decibels.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TLV5613CDW	ACTIVE	SOIC	DW	20	25	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	0 to 70	TLV5613C	Samples
TLV5613CPW	ACTIVE	TSSOP	PW	20	70	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	0 to 70	TV5613	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
