8 Detailed Description

8.1 Overview

The TUSB1046A-DCI is a VESA USB Type-C Alt Mode redriving switch supporting data rates up to 8.1 Gbps for downstream facing port. These devices utilize 5th generation USB redriver technology. The devices are utilized for DFP configurations C, D, E, and F from the VESA DisplayPort Alt Mode on USB Type-C.

The TUSB1046A-DCI provides several levels of receive equalization to compensate for cable and board trace loss due to inter-symbol interference (ISI) when USB 3.1 Gen1/Gen2 or DisplayPort 1.4 signals travel across a PCB or cable. This device requires a 3.3-V power supply. It comes in a commercial temperature range and industrial temperature range.

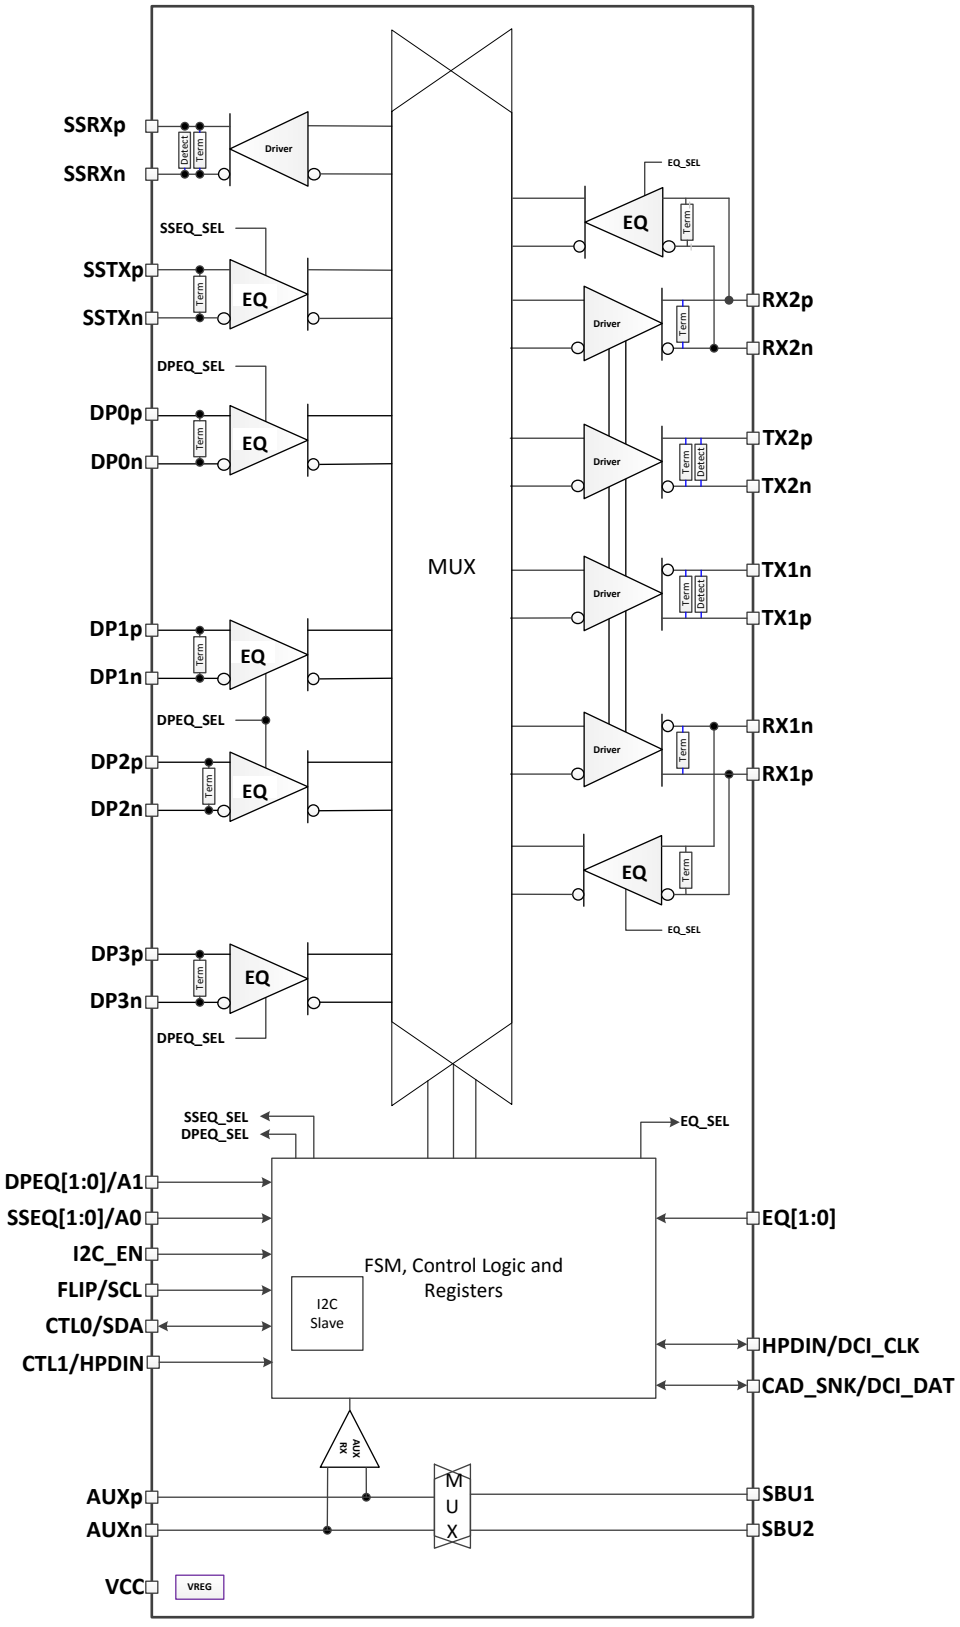

For a host application the TUSB1046A-DCI enables the system to pass both transmitter compliance and receiver jitter tolerance tests for USB 3.1 Gen1/Gen2 and DisplayPort version 1.4 HBR3. The re-driver recovers incoming data by applying equalization that compensates for channel loss, and drives out signals with a high differential voltage. Each channel has a receiver equalizer with selectable gain settings. The equalization should be set based on the amount of insertion loss before the TUSB1046A-DCI receivers. Independent equalization control for each channel can be set using EQ[1:0], SSEQ[1:0], and DPEQ[1:0] pins.

The TUSB1046A-DCI advanced state machine makes it transparent to hosts and devices. After power up, the TUSB1046A-DCI. periodically performs receiver detection on the TX pairs. If it detects a USB 3.1 Gen1/Gen2 receiver, the RX termination is enabled, and the TUSB1046A-DCI is ready to re-drive.

The device ultra-low-power architecture operates at a 3.3-V power supply and achieves enhanced performance. The automatic LFPS de-emphasis control further enables the system to be USB3.1 compliant.

8.3 Feature Description

8.3.1 USB 3.1

The TUSB1046A-DCI supports USB 3.1 Gen1/Gen2 datarates up to 10 Gbps. The TUSB1046A-DCI supports all the USB defined power states (U0, U1, U2, and U3). Because the TUSB1046A-DCI is a linear redriver, it can't decode USB3.1 physical layer traffic. The TUSB1046A-DCI monitors the actual physical layer conditions like receiver termination, electrical idle, LFPS, and SuperSpeed signaling rate to determine the USB power state of the USB 3.1 interface.

The TUSB1046A-DCI features an intelligent low frequency periodic signaling (LFPS) detector. The LFPS detector automatically senses the low frequency signals and disables receiver equalization functionality. When not receiving LFPS, the TUSB1046A-DCI will enable receiver equalization based on the EQ[1:0] and SSEQ[1:0] pins or values programmed into EQ1_SEL, EQ2_SEL, and SSEQ_SEL registers.

8.3.2 DisplayPort

The TUSB1046A-DCI supports up to 4 DisplayPort lanes at datarates up to 8.1Gbps (HBR3). The TUSB1046A-DCI, when configured in DisplayPort mode, monitors the native AUX traffic as it traverses between DisplayPort source and DisplayPort sink. For the purposes of reducing power, the TUSB1046A-DCI manages the number of active DisplayPort lanes based on the content of the AUX transactions. The TUSB1046A-DCI snoops native AUX writes to DisplayPort sink's DPCD registers 0x00101 (LANE_COUNT_SET) and 0x00600 (SET_POWER_STATE). TUSB1046A-DCI disables/enables lanes based on value written to LANE_COUNT_SET. The TUSB1046A-DCI disables all lanes when SET_POWER_STATE is in the D3. Otherwise active lanes will be based on value of LANE_COUNT_SET.

DisplayPort AUX snooping is enabled by default but can be disabled by changing the AUX_SNOOP_DISABLE register. Once AUX snoop is disabled, management of TUSB1046A-DCI DisplayPort lanes are controlled through various configuration registers. When TUSB1046A-DCI is enabled for GPIO mode (I2C_EN = "0"), the CAD_SNK pin can be used to disable AUX snooping. When CAD_SNK pin is high, the AUX snooping functionality is disabled and all four DisplayPort lanes will be active.

8.3.3 4-level Inputs

The TUSB1046A-DCI has (I2C_EN, EQ[1:0], DPEQ[1:0], and SSEQ[1:0]) 4-level inputs pins that are used to control the equalization gain and place TUSB1046A-DCI into different modes of operation. These 4-level inputs utilize a resistor divider to help set the 4 valid levels and provide a wider range of control settings. There is an internal 30 kΩ pull-up and a 94 kΩ pull-down. These resistors, together with the external resistor connection combine to achieve the desired voltage level.

Table 1. 4-Level Control Pin Settings

LEVEL	SETTINGS
0	Option 1: Tie 1 KΩ 5% to GND. Option 2: Tie directly to GND.
R	Tie 20 KΩ 5% to GND.
F	Float (leave pin open)
1	Option 1: Tie 1 KΩ 5%to V_{CC}. Option 2: Tie directly to V_{CC}.

Copyright © 2017–2019, Texas Instruments Incorporated

NOTE

All four-level inputs are latched on rising edge of internal reset. After t_{cfg_hd}, the internal pull-up and pull-down resistors will be isolated in order to save power.

8.3.4 Receiver Linear Equalization

The purpose of receiver equalization is to compensate for channel insertion loss and inter-symbol interference in the system before the input of the TUSB1046A-DCI. The receiver overcomes these losses by attenuating the low frequency components of the signals with respect to the high frequency components. The proper gain setting should be selected to match the channel insertion loss before the input of the TUSB1046A-DCI receivers. Two 4-level inputs pins enable up to 16 possible equalization settings. USB3.1 upstream path, USB3.1 downstream path, and DisplayPort each have their own two 4-level inputs. The TUSB1046A-DCI also provides the flexibility of adjusting settings through I^2C registers.

8.4 Device Functional Modes

8.4.1 Device Configuration in GPIO Mode

The TUSB1046A-DCI is in GPIO configuration when I2C_EN = “0”. The TUSB1046A-DCI supports the following configurations: USB 3.1 only, 2 DisplayPort lanes + USB 3.1, or 4 DisplayPort lanes (no USB 3.1). The CTL1 pin controls whether DisplayPort is enabled. The combination of CTL1 and CTL0 selects between USB 3.1 only, 2 lanes of DisplayPort, or 4-lanes of DisplayPort as detailed in Table 2. The AUXp or AUXn to SBU1 or SBU2 mapping is controlled based on Table 3.

After power-up (V_{CC} from 0 V to 3.3 V), the TUSB1046A-DCI defaults to USB3.1 mode. The USB PD controller upon detecting no device attached to Type-C port or USB3.1 operation not required by attached device must take TUSB1046A-DCI out of USB3.1 mode by transitioning the CTL0 pin from L to H and back to L.

8.4.2 Device Configuration In I²C Mode

The TUSB1046A-DCI is in I²C mode when I2C_EN is not equal to “0”. The same configurations defined in GPIO mode are also available in I²C mode. The TUSB1046A-DCI USB3.1 and DisplayPort configuration is controlled based on Table 5. The AUXp or AUXn to SBU1 or SBU2 mapping control is based on Table 6.

8.4.3 DisplayPort Mode

The TUSB1046A-DCI supports up to four DisplayPort lanes at datarates up to 8.1 Gbps. TUSB1046A-DCI can be enabled for DisplayPort through GPIO control or through I²C register control. When I2C_EN is ‘0’, DisplayPort is controlled based on Table 2. When not in GPIO mode, enable of DisplayPort functionality is controlled through I²C registers.

8.4.4 Linear EQ Configuration

Each of the TUSB1046A-DCI receiver lanes has individual controls for receiver equalization. The receiver equalization gain value can be controlled either through I^2C registers or through GPIOs. Table 7 details the gain value for each available combination when TUSB1046A-DCI is in GPIO mode. These same options are also available in I^2C mode by updating registers DP0EQ_SEL, DP1EQ_SEL, DP2EQ_SEL, DP3EQ_SEL, EQ1_SEL, EQ2_SEL, and SSEQ_SEL.

8.4.5 USB3.1 Modes

The TUSB1046A-DCI monitors the physical layer conditions like receiver termination, electrical idle, LFPS, and SuperSpeed signaling rate to determine the state of the USB3.1 interface. Depending on the state of the USB 3.1 interface, the TUSB1046A-DCI can be in one of four primary modes of operation when USB 3.1 is enabled (CTL0 = H or CTLSEL0 = 1b1): Disconnect, U2/U3, U1, and U0.

The Disconnect mode is the state in which TUSB1046A-DCI has not detected far-end termination on both upstream facing port (UFP) or downstream facing port (DFP). The disconnect mode is the lowest power mode of each of the four modes. The TUSB1046A-DCI remains in this mode until far-end receiver termination has been detected on both UFP and DFP. The TUSB1046A-DCI immediately exits this mode and enter U0 once far-end termination is detected.

Once in U0 mode, the TUSB1046A-DCI will redrive all traffic received on UFP and DFP. U0 is the highest power mode of all USB3.1 modes. The TUSB1046A-DCI remains in U0 mode until electrical idle occurs on both UFP and DFP. Upon detecting electrical idle, the TUSB1046A-DCI immediately transitions to U1.

The U1 mode is the intermediate mode between U0 mode and U2/U3 mode. In U1 mode, the TUSB1046A-DCI UFP and DFP receiver termination remains enabled. The UFP and DFP transmitter DC common mode is maintained. The power consumption in U1 is similar to power consumption of U0.

Next to the disconnect mode, the U2/U3 mode is next lowest power state. While in this mode, the TUSB1046A-DCI periodically performs far-end receiver detection. Anytime the far-end receiver termination is not detected on either UFP or DFP, the TUSB1046A-DCI leaves the U2/U3 mode and transitions to the Disconnect mode. It also monitors for a valid LFPS. Upon detection of a valid LFPS, the TUSB1046A-DCI immediately transitions to the U0 mode. In U2/U3 mode, the TUSB1046A-DCI receiver terminations remain enabled but the TX DC common mode voltage is not maintained.

For further programmability, the TUSB1046A-DCI can be controlled using I^{2}C. The SCL and SDA pins are used for I^{2}C clock and I^{2}C data respectively.

The following procedure should be followed to write to TUSB1046A-DCI I^{2}C registers:

1. The master initiates a write operation by generating a start condition (S), followed by the TUSB1046A-DCI 7-bit address and a zero-value “W/R” bit to indicate a write cycle.
2. The TUSB1046A-DCI acknowledges the address cycle.
3. The master presents the sub-address (I^{2}C register within TUSB1046A-DCI) to be written, consisting of one byte of data, MSB-first.
4. The TUSB1046A-DCI acknowledges the sub-address cycle.
5. The master presents the first byte of data to be written to the I^{2}C register.
6. The TUSB1046A-DCI acknowledges the byte transfer.
7. The master may continue presenting additional bytes of data to be written, with each byte transfer completing with an acknowledge from the TUSB1046A-DCI.
8. The master terminates the write operation by generating a stop condition (P).

The following procedure should be followed to read the TUSB1046A-DCI I^{2}C registers:

1. The master initiates a read operation by generating a start condition (S), followed by the TUSB1046A-DCI 7-bit address and a one-value “W/R” bit to indicate a read cycle.
2. The TUSB1046A-DCI acknowledges the address cycle.
3. The TUSB1046A-DCI transmit the contents of the memory registers MSB-first starting at register 00h or last read sub-address+1. If a write to the T I^{2}C register occurred prior to the read, then the TUSB1046A-DCI shall start at the sub-address specified in the write.
4. The TUSB1046A-DCI shall wait for either an acknowledge (ACK) or a not-acknowledge (NACK) from the master after each byte transfer; the I^{2}C master acknowledges reception of each data byte transfer.
5. If an ACK is received, the TUSB1046A-DCI transmits the next byte of data.
6. The master terminates the read operation by generating a stop condition (P).

The following procedure should be followed for setting a starting sub-address for I^{2}C reads:

1. The master initiates a write operation by generating a start condition (S), followed by the TUSB1046A-DCI 7-bit address and a zero-value “W/R” bit to indicate a write cycle.
2. The TUSB1046A-DCI acknowledges the address cycle.
3. The master presents the sub-address (I^{2}C register within TUSB1046A-DCI) to be written, consisting of one byte of data, MSB-first.

Copyright © 2017–2019, Texas Instruments Incorporated

4. The TUSB1046A-DCI acknowledges the sub-address cycle.
5. The master terminates the write operation by generating a stop condition (P).

NOTE

If no sub-addressing is included for the read procedure, and reads start at register offset 00h and continue byte by byte through the registers until the I^2C master terminates the read operation. If a I^2C address write occurred prior to the read, then the reads start at the sub-address specified by the address write.

9 Application and Implementation

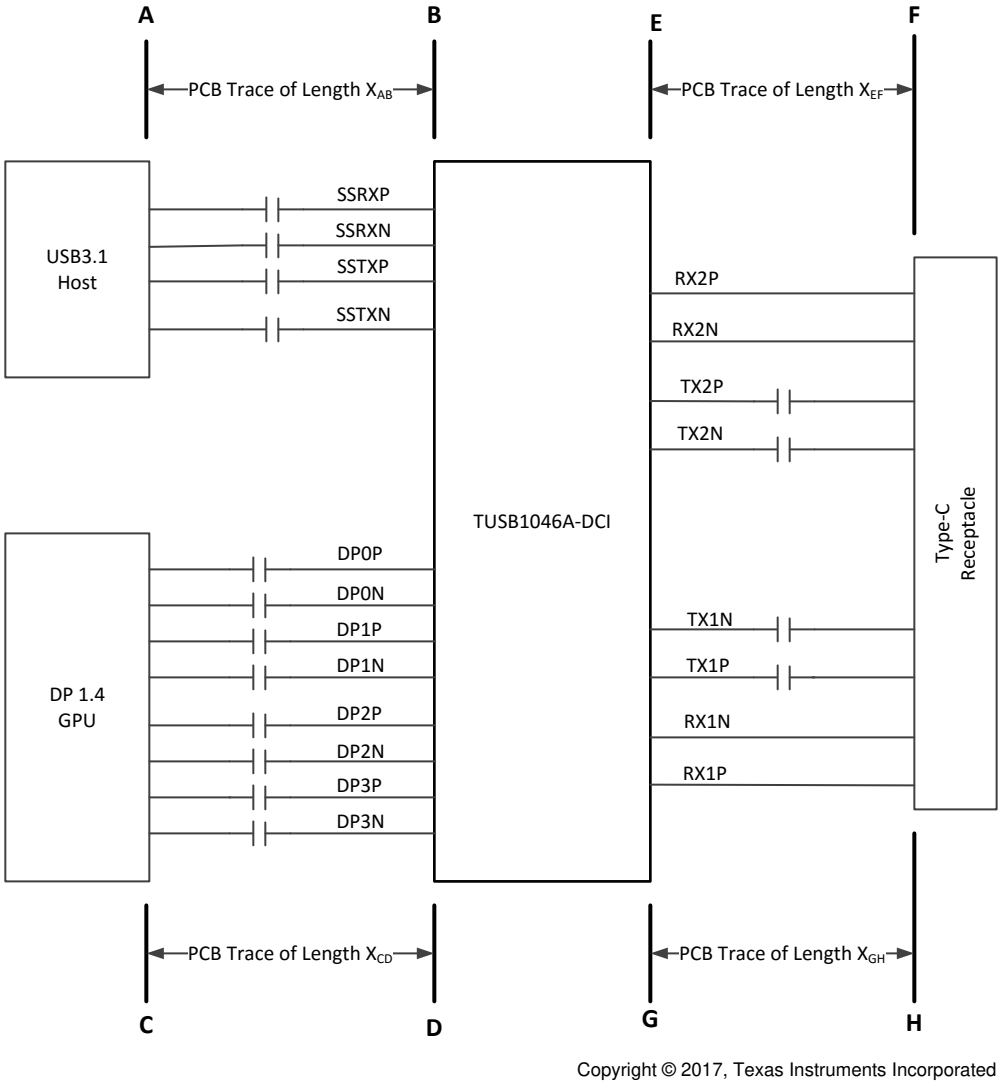

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The TUSB1046-DCI is a linear redriver designed specifically to compensation for intersymbol interference (ISI) jitter caused by signal attenuation through a passive medium like PCB traces and cables. Because the TUSB1046-DCI has four independent DisplayPort 1.4 inputs, one upstream facing USB 3.1 Gen1/Gen2 input, and two downstream facing USB 3.1 Gen1/Gen2 inputs, it can be optimized to correct ISI on all those seven inputs through 16 different equalization choices. Placing the TUSB1046-DCI between a USB3.1 Host/DisplayPort 1.4 GPU and a USB3.1 Type-C receptacle can correct signal integrity issues resulting in a more robust system.

9.2 Typical Application

Figure 27. TUSB1046-DCI in a Host Application

Typical Application (continued)

9.2.1 Design Requirements

For this design example, use the parameters shown in Table 19.

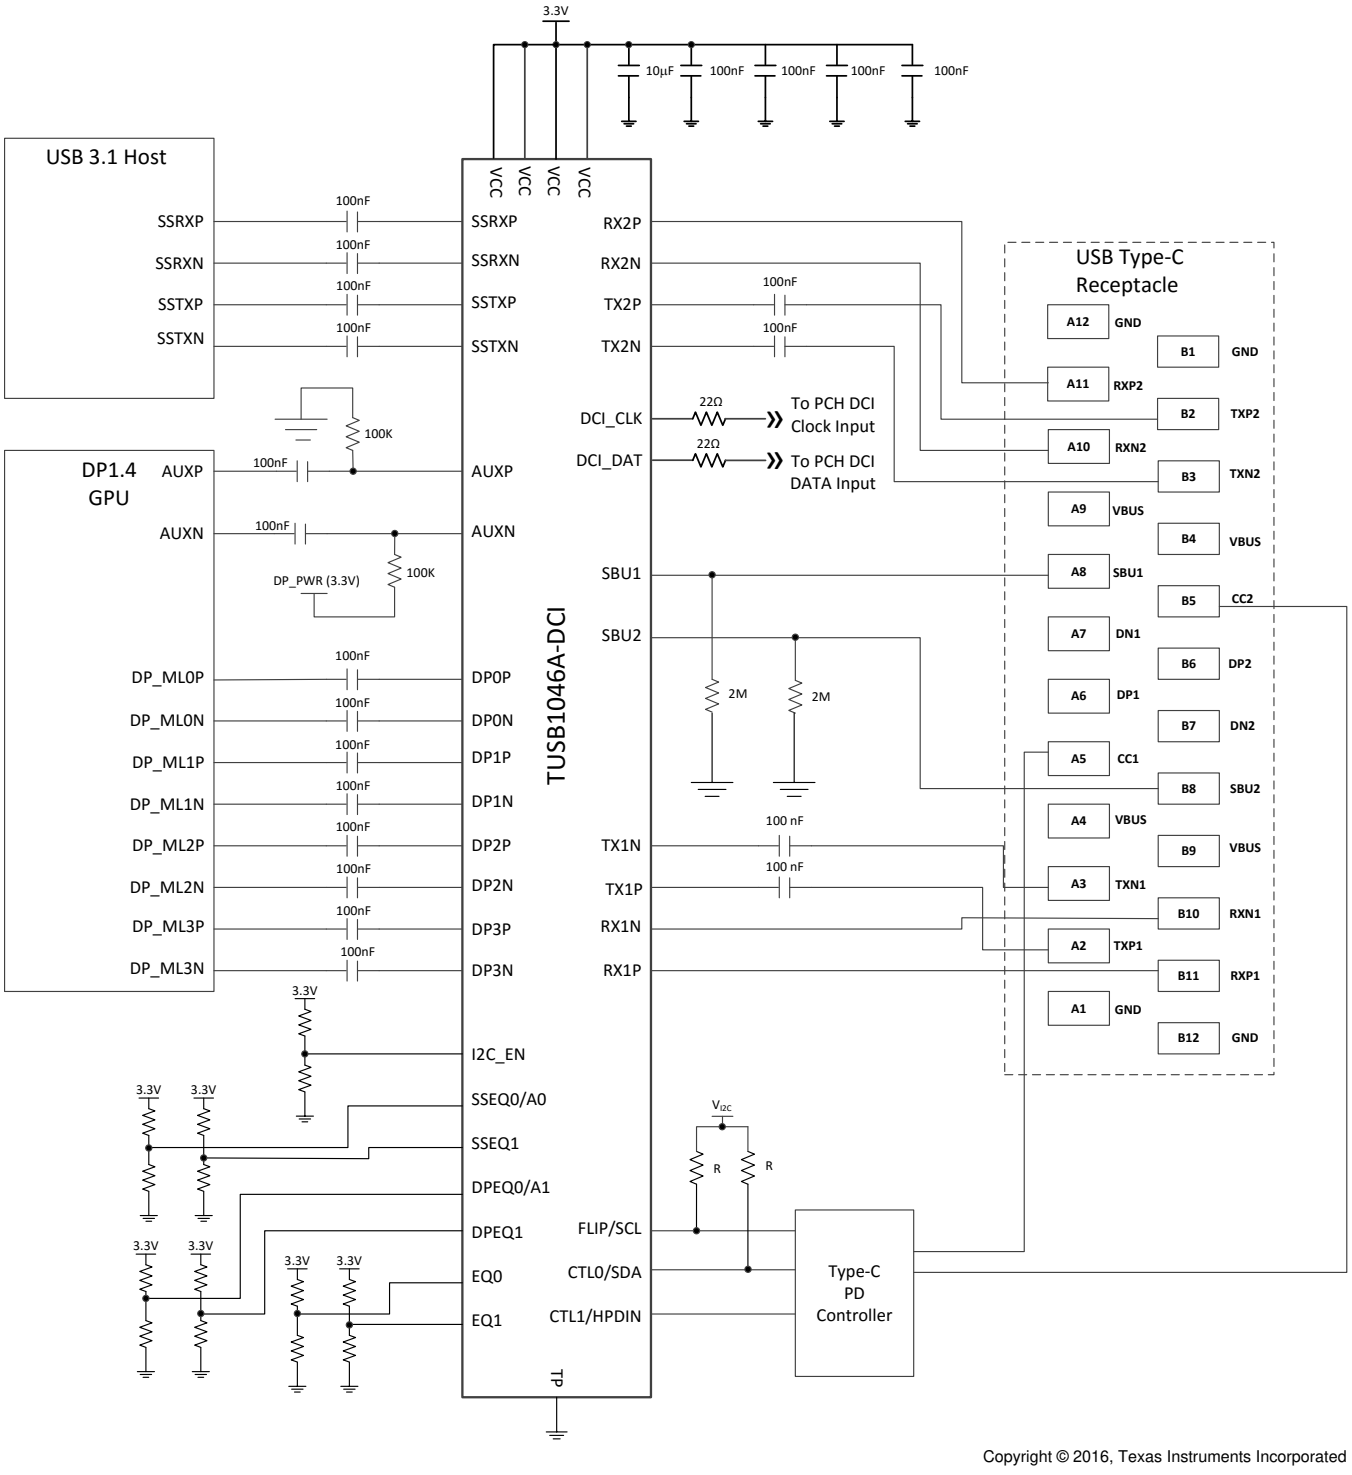

Table 19. Design Parameters

PARAMETER	VALUE
A to B PCB trace length, X_{AB}	12 inches
C to D PCB trace length, X_{CD}	12 inches
E to F PCB trace length, X_{EF}	2 inches
G to H PCB trace length, X_{GH}	2 inches
PCB trace width	4 mils
AC-coupling capacitor (75 nF to 265 nF)	100 nF
VCC supply (3 V to 3.6 V)	3.3 V
I2C Mode or GPIO Mode	I2C Mode. (I2C_EN pin != "0")
1.8V or 3.3V I2C Interface	3.3V I2C. Pull-up the I2C_EN pin to 3.3V with a 1K ohm resistor.

9.2.2 Detailed Design Procedure

A typical usage of the TUSB1046-DCI device is shown in Figure 28. The device can be controlled either through its GPIO pins or through its I^2C interface. In the example shown below, a Type-C PD controller is used to configure the device through the I^2C interface. When configured for I2C mode, pins 29 (RSVD1) and 32 (RSVD2) can be left unconnected. In I2C mode, the equalization settings for each receiver can be independently controlled through I2C registers. For this reason, all of the equalization pins (EQ[1:0], SSEQ[1:0], and DPEQ[1:0]) can be left unconnected. If these pins are left unconnected, the TUSB1046-DCI 7-bit I2C slave address will be 0x12 because both DPEQ/A1 and SSEQ0/A0 will be at pin level "F". If a different I2C slave address is desired, DPEQ/A1 and SSEQ0/A0 pins should be set to a level which produces the desired I2C slave address.

10 Power Supply Recommendations

The TUSB1046-DCI is designed to operate with a 3.3-V power supply. Levels above those listed in the *Absolute Maximum Ratings* table should not be used. If using a higher voltage system power supply, a voltage regulator can be used to step down to 3.3 V. Decoupling capacitors should be used to reduce noise and improve power supply integrity. A 0.1-µF capacitor should be used on each power pin.

11 Layout

11.1 Layout Guidelines

1. RXP/N and TXP/N pairs should be routed with controlled 90-Ω differential impedance (±15%).
2. Keep away from other high speed signals.
3. Intra-pair routing should be kept to within 2 mils.
4. Length matching should be near the location of mismatch.
5. Each pair should be separated at least by 3 times the signal trace width.
6. The use of bends in differential traces should be kept to a minimum. When bends are used, the number of left and right bends should be as equal as possible and the angle of the bend should be ≥ 135 degrees. This will minimize any length mismatch causes by the bends and therefore minimize the impact bends have on EMI.
7. Route all differential pairs on the same of layer.
8. The number of vias should be kept to a minimum. It is recommended to keep the vias count to 2 or less.
9. Keep traces on layers adjacent to ground plane.
10. Do not route differential pairs over any plane split.
11. Adding Test points will cause impedance discontinuity, and therefore, negatively impact signal performance. If test points are used, they should be placed in series and symmetrically. They must not be placed in a manner that causes a stub on the differential pair.
